Hook the cathode (banded) end of a diode to the + meter terminal. Connect a wire from the - meter terminal to your rig's chassis or something else that's grounded. Connect a ceramic capacitor (one of the flat jobs, round or square) of any value from about .001 uF to 0.1 uF between the meter terminals. Then connect a wire to the other end of the diode and dangle it around the shack. Start with a short wire so you don't damage the meter with too much deflection. Adjust the deflection by changing the length and position of this wire.

Have fun!

I have a matched pair of new Motorola
MRF-247 transistors, I bought these
from RF Parts a few years ago to repair
a 160 watt 2m amp....never got around to
doing the job. I want $40.00 for the
pair... i'll pay the postage.

Message-ID: <32d0eb2c.15867777@news.connectnet.com>
Source record: 99056

Aircraft radios should be a drug on the market because the new regs mean a lot of them do not meet the 30ppm freq tolerance rule. Most are 12 volt units with a freq range of 118.0 to 135.95 mc in tenth mc steps, 5-10 watts output, AM. Transmit with carbon mikes. Some have 108.0 to 115.95 additional receivers built in to receive VOR and Loc. stations. If interested, I have a list of some of them for sale. send email to av@pdsig.com for an auto-response list.

Hi,

picked up some surplus commercial VHF radios at a recent Hamfest and
wondered if anyone knew the bandwidth for the following crystal filters:

HyQ "QF10701" and "QF10A7"
HCM "10M-4B"
Phillips "10.7N" and "10.7P"
Murata "CFM455F" and "CFM455D"

Thanks in advance,

Richard VK6FKB

ps - if these are of use to you then let me know!!

:>

In this day and age why would anyone publish what is exxentially a
database or infromation retrieval product that *required* its users
to use a specific operating environment? Particularly, when there are
at least three four other operating environments (DOS, Macintosh, Unix,
OS/2) in use among the product's target audience?

Everything that is done with the Windows database could have been done
just as easily, perhaps more easily, with HTML coding ... then the CD
ROMS would have been operating system independent. The user would only
need to furnish an appropriate HTML engine (aka Web Browser) for his
particular system.

HTML retrieval and display systems are here, more importantly they will
be around for quite some time ... and are platform independent.

As it is, I'm waiting on the OS/2 version of the QST CDROMS for my
personal system and the Macintosh version for my wife's system.

I don't entirely agree with this statement; most of the energy that
burns things up is low frequency, about 5 KHz. Most of the successful
output networks we've designed include an output blocking capacitor.
The voltage spike is limited by a spark gap. The average power is
limited by a series capacitor.

>A simple T
>network antenna tuner or high pass or band pass filter would do much more

>than transmit type surge suppressors.

I agree with the paragraph above entirely. But I would not operate
myself without a lightning arrestor (even if only a spark gap) across
the feedline to the building where the feedline(s) tie to the shack
ground.

If I remember correctly, the National Electical Code requires that feedlines
be grounded when entering a building. If this is the case, if there were
damage to the building and the lines were not grounded, your insurance
commpany could refuse to pay.

Note that a good direct current ground, is not necessarily a good
RF ground and vice versa.

Geoff.

> filament voltage, and instructions for the proper settings for each line
> voltage range.

Primary taps are not nearly as flexible as a rheostat. Since a 3% change
in filament voltage results in doubling---or halving---the useful emission
life of the amplifier tube, transformer taps should be substantively
closer than 3% apart.

Tom:
1. How far apart are the transformer taps (in Ameritron amplifiers)?
2. Are the taps switch-selectable---or is disassembly required to change
taps as the electric-mains (line) voltage rises and falls?
3. Can the filament voltage be measured without disassembling the amplifier?
4. Is a separate filament transformer used?

...snip...

This issue seems to boil down to two things: Are we going to believe the
statement on page 141 in Eimac's *Care and Feeding of Power Grid Tubes*?
Is the algebraic expression [E1/E2]^23.4 correct?

Where's the beef, Mr. Rauch?

Do our "recognized amplifier experts" understand algebra?

I believe that these are too inductive for my purposes, but I haven't
really checked it out. I am looking for something with bulk
resistivity. There were several good suggestions about using water
directly. And, one suggestion for making your own resistor. I must
admit it sounded a little like a pipe bomb to me. My biggest problem
is not the cost (although that is a consideration), but the "messing
around time" getting something to work. I have settled on a solution
which consists of a large ferrite transformer to step the impedance
down to drive two 5 kW 50 ohm water cooled loads. I already have a
handle on the transformer technology since each of the four power
modules has a transformer, which I made, in its output. The step down
transformer is just 4 times as big in volume of the core.

Thanks for your observaton.

HI John,

Some of these newer electrolytics have pie slice type serrations (sp)
on the top and these stressed points give way when it blows and believe
you me they will blow with vigor. As to the stress point on the
positive terminal for a PC mount that could be interesting given a
severe failure, but guess it would work if the cap separates from the
terminal and the negative mounting terminal bends enough to let the
thing vent. The size reduction is impressive given the size of the old
FP styles and early computer grades.

Hello Paul - it sounds like you are going to have a blast with these units!

You will need the file MANUALS.TXT to find out who has the manuals.
It is available at my website (URL below) in the ham radio resources
section.

While you are at it, get xtals.txt also and you will know where to
obtain the crystals you will need for it on 6 meters also!

Happy New Year - Bry, AF4K

> hobbes99@ziplink.net

I have a page that describes a six-meter duplexer that can
be scaled to 440 MHz. We scaled the six design to two meters
even though I don't mention it on the page.

If you do scale the six meter design to 440 MHz you can probably
use 1/2" Heliax instead of 1 1/4".

The page is at:
http://www.dallas.net/~jvpoll/dup6m/dup.html

Hope this helps.
Jim

>
> Bob AA0MC
>
It is so. But there is a sneaky way around it, for the lower frequencies, at least. If the wire is wound on a ceramic form in the form of a traditional coil it will have considerable inductive reactance. BUT if in the exact center the direction of the winding is reversed (not layered but cw vs ccw), and the whole thing is symetrical, and close coupled to ensure mutual inductance, the inductance will largely cancel and you are left with the resistance.

General Radio did this year ago, making wirewound non-inductive resistors.

Know however that the R will change with temperature (power into the load); not exactly ideal. I'm not sure how fast nichrome changes R, maybe someone else would know.

The internal noise of even the worse resistor is meaningless in this
application. There is almost no current flow, and any current that does
flow would be caused by noise much larger than the noise generated in the
resistance.

Who cares what kind of resistor it is, so long as the RF impedance is very
high.

Arguing optimum ESD protection in unknown systems is like arguing the
number of angels on the head of a pin. There are too many variables.

The only safe thing is to bleed off any static charge during
non-threatning weather, and unhook everything during threatning weather.
Anything else is a wild guess as to how much it helps.

Hi Rich,

In article <measures-3112960244070001@port27.vcnet.com>,
measures@mail.vcnet.com (R. L. Measures) writes:

>he lower filament voltage. Of course, in actual practice, this is not
>quite realizeable because the filament voltage normally needs to be
>increased as the tube nears the end of its useful emissive life. Thus, a
>rheostat to control filament voltage is is rather useful. However, to
>the best of my knowledge, none of the commercial manufacturers provide a
>means of adjusting filament voltage. Art Collins typically provided a
>means of adjusting an amplifier's filament voltage.

All current production Ameritron PA's include a method of adjusting
voltage as well as a way of approximately determining when the PA filament
is likely being operated at excessive voltage. I assume you didn't look
very hard at all PA's.

>This issue seems to boil down to two things: Are we going to believe the
>statement on page 141 in Eimac's *Care and Feeding of Power Grid Tubes*?

>Is the algebraic expression [E1/E2]^23.4 correct?

I probably wasn't clear on two points. The formula does not contain
descriptions of what E1 is, E2 is, where it came from, and what the result
is (hours, days, percent, etc).

Secondly the issue wasn't the accuracy of the Eimac "Power Grid Tube
book", it was the source of **your** data. With the past track history of
misquoted facts and data, I just felt confirmation from a second source
would be better. So I still wonder...

Can anyone else confirm the 922 or Commander has the filament voltage Rich
claims?

Can anyone report short emission life on a 3-500Z used in a Kenwood??

Perhaps you made a mistake in measuring or reporting the voltage in the
Kenwood or in the Command PA??

73 Tom

29. 20, 30 or 40 M home brew reciever/transciever

I'd be curious to know if anyone has successfully converted one of
these to 2M (it can't be that big a leap) and if so what it takes. I
assume they use synthesis of some sort.

People dump on AM a lot but I kinda like it.

Any thoughts out there?

Excuse me?? Corona during receive? Possibly due to the absurdly low humidity.
Did anyone know that the balls on car antennas are due to corona buildup during
driving, due to the rubber (er, compound) rubbing on the road?
Is this some kind of weird related effect?

Sounds like you guys are in the twilight zone of receivers here. I'll buy into the resistor theory if it is a good low noise high value resistor like a metal film of about 1 meg. Carbon has a bad way of inducing its own noise, which I don't think you would want. If you want a vendor of high voltage resistors try Angstromm-Jordan, which I believe may now be a division of Vishay. $10.00 a pop, but it may well be the answer. Windy weather tipped me off that cars had that same problem as soon as speeds went over 30-40 mph average so it may be some kind of electron accumulation due to the wind.

Don't forget the ripple-current rating. Using a perfectly good capacitor with AC currents in excess of its ripple-current rating will cause internal heating and early failure.

As Bob said, split lines are deliberately stamped into the closed end of the can, so that the can will fail gently at that location rather than building up extreme pressure. (Usually this works...)

Rubycon capacitors seem to be very common, and you can probably find the type you have in a catalog from one of the big distributors. If there isn't a type number on the capacitors you can usually find it by matching the capacitance, voltage, maximum temperature, tag connections and external dimensions. With luck the catalog will then give the ripple-current rating.

My guess would be about 1A, but you might be lucky enough to have a low series resistance type rated at about 2A.

In capacitor-input power supplies, a rule of thumb is to use capacitors with a ripple-current rating about of 2 times the average DC current.

It's obviously more complicated than that - for example, the ripple-current rating decreases with operating temperature - but a factor of 2 is a good place to start.

>The size reduction is impressive given the size of the old
>FP styles and early computer grades.
>
That's certainly true. You can tell the guys who were raised on big electrolytics - they're the ones with crossed fingers!

The "coherer" was (I think) the first RF detector. It was
made of a small glass tube filled with iron powder :)

You had to delicately shake the thing until you hear some
reception. I build one (when I was a kid) and never had any
results with it. I suppose that iron had to be a little
oxydized to act as a semiconductor and the coherer work as
a "Diode".

I have a GAP vir. it has no dc return. I have used 3 @ 2.7k 2w composition carbon resistors is series across its center (gap) with good results. Gap states their impedance at this point is close to 50 ohms, hence less than 1% of TX power goes to the resistors. I have no noise problem from them. They are in a heat shrink insulator for the environment.

Some of the rigs are synthesized, but I remember some of the older ones, either hybrid tube and SS technology, all-tube, or all SS which used a multiple mix scheme with a bucket-full of crystals to cover the appropriate bands. Also might be nice to know that these are AM rigs.

57. High voltage, low inductance feedthru capacitors wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-03 00:00:00 UTC
From: jpotter@jpaw.com
Message-ID: <32cd8a16.107188482@news.santafe.edu>
Source record: 99007
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.components

I am looking for a source of feedthrough capacitors of a few hundred to 1000 pf capacitance at 10 kV. It is important that the capacitor be low inductance for use in decoupling power leads at 400 - 600 MHz. I recently purchased, from RF Parts, a 680 pf feedthrough capacitor rated at 6 kV, made by Sprague in 1977 that would be OK if only it were rated at 10 kV.

I have an alternative solution, making coaxial feedthrough capacitors using FEP teflon shrink tubing, but these are a bit bulky and, of course, have to be fabricated. I am looking for store bought alternatives.

Thanks,

65. Q re custom radio transmitter design

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-03 00:00:00 UTC
From: fletcher@hookup.net
Message-ID: <32d01da9.5039038@nnrp.ott.hookup.net>
Source record: 99015
Cross-posted to: sci.electronics.design,rec.radio.amateur.homebrew

I don't know much more than the basics about radio transmitters and electronic circuit design but hope someone out there can either help me or point me in the right direction. Here's what I'm looking for:

Can I buy/have made/make a transmitter that would send a regular radio burst that I could monitor within say a 1km radius. It would need to be able to carry information from an attached device which could be a voltage (for example, a thermistor) and I'd need to be able to decode it. I had hoped that some sort of capacitor would be able to discharge through a filter of some sort to send a pulse out. Ideally, it would be low power (able to recharge via a small solar panel) and withstand outside weather extremes (+100F to -40F).

If there are off the shelf products, I'd love to know where they can be found. If there aren't, I'd be interested in communicating with anyone who might be capable and interested in the possibility of designing and prototyping something that might do it.

I can and will check these newsgroups for a response but an email will get to me more reliably.

Tom, was this measured, or from the spec sheet?

The Rubycon caps that John Lockhart was referring to in his original post (he got them from me) are from their MXR line, 450 uF/450 V.

Their ripple current rating is 1.80 Arms/120 Hz @ 105 degrees C.

Regards,

- Jeff, WA6AHL

(John, by the way the rest of the specs are:

Operating Temp: -25 - +105 degrees C

Cap. Tolerance: +/- 20% (at 20 degrees C, 120 Hz)

Leakage current: I = 3root(CV), where I = uA, C = uF, V = rated voltage (from the data sheet this looks like 3 * sqrt(C*V), but it's ambiguous enough that it might be cube_root(C*V).

Dissipation Factor (Max): Tan delta = 0.15 (20 degrees, 120 Hz)

Enjoy 'em! - Jeff)

You're starting from the wrong point.

CATV processors and modulators put out much less power that 1 watt.
The output is 55 dbmv - decibels referenced to milli-volts, and into
a 75 ohm load. 0 dbmv=1000 microvolts into 75 ohms.

55 dbmv works out a little under 100 milliwatts if I remember correctly.

Most CATV frequency-agile modulators are still lots of fun to play with,
with very clean outputs and good stability.

What brand/model are they? I may have the service manuals for them
lying around somewhere.

Steve Erley

+55dBm?? Yes, that should be enough to push most any (legal) ham
amplifier. 0dBm is 1 milliwatt. Each 10dB multiplies the power
by 10. So +55dBm is 5dB above 100 watts, and 5dB below 1000 watts,
so it would be 316 watts. Think you can drive your amplifier with
that?? ;-)

Charles.Mccurdy@1492.conchbbs.com (Charles Mccurdy) writes:

=Hi can any one give me any info on how to make a 100 watt dummy load?

=73s kc5cxu

The ARRL Handbook has a couple of excellent construction articles
on HF, VHF and UHF dummy antennas. Really all you need for a 100
watt dummy antenna is a 100 watt ceramic resistor. If you want
it to be a dry dummy load you should use a 150 or 200 watt resistor.
DON'T use a wire-wound resistor, you'll have problems with different
impedances at different frequencies.

Kevin, WB5RUE
I am Voltohm of Borg! Resistance is E/I, Power is EI, you will
be attenuated!

There are three kinds of people in the world, those who can
count and those who can't.

Depends on the frequency. For up to 30 MHz you can put a bunch of 2W resistors together. You can stretch the power rating for brief tests by immersing the thing in a can of oil.

A better solution is a Carborundum bulk ceramic non-inductive resistor. You can buy those a number of places, including Surplus Sales of Nebraska, phone 402-346-4750, $49.

Or you can find a "Cantenna" from Heathkit. This was a 50 ohm 100 W resistor in a 1 gallon paint can that you filled with oil. Original cost as a kit was about $20.

The power ratio represented by 55dB is antilog 55/10, which comes to
316227.766. Since dBm references one milliwatt, that would be roughly 316
watts. I bet you could even calculate this with 123 ;)
That would make a dandy ATV amp, if that's really the output.

If you can't find a 100w 50 ohm resistor, 2 50w 100 ohm in parallel
work just fine. Use your head & the knowledge you indicated you had
when you passed your exam and put together a bunch of resistors so the
effective impedence is 50 ohms with a total of 100 watt dissapation.

>I thought the P3D power output and antenna gain is high enough to
>allow the use of omni antennas on the ground. Is this not true?

P3D will have more power, but from what I understand that power will
be used to have more than one mode active at the same time, IE the
power will be spread over more bandwidth. So you'll still need at
least a minimum Oscar 10 class receiving station for most activities
near apogee. At perigee it should kick butt, but it will spend a lot
more time out toward apogee so you should plan your station accordingly.

One big advantage will be the 3-axis stablization it will use.
That means the gain antennas will always be nadir pointing.
The problems we had with O10 and O13 due to poor squint angles
should be gone. It won't have to switch to its omni antennas at
perigee. And spin modulation shouldn't be an issue either. This
will lessen Earth station requirements somewhat. I don't know
if omni antennas will suffice, though. The receivers on P3D
won't be any better than those on O13, so you'll still need a
fair amount of uplink ERP even with gain antennas on the satellite.
I suppose you could use an amp into an omni, but it seems to me to
be better to use steerable beams for both up and down links.

Thanks for the information, Jeff.

Tom - please could you explain more about your reservations?
On the face of it, they look OK for a nominal 1A DC supply (at least for intermittent amateur use).

One does not need to look very hard at an amplifier diagram to see whether
or not a rheostat is used to control filament voltage. Currently, none of
the MFJ/Ameritron amplifiers appear to have it.

> >This issue seems to boil down to two things: Are we going to believe the

>
Bzzzzzzzzzzzzzt. Looks like I'd better pick up some more smoke detector
batteries the next time I go to Price Club.

Mr. Rauch's original question is:
> I do wonder where Richard got the formula [E1/E2]^23.5. Is the answer in
> hours, percent, seconds, or ratio? Where does it come from?
>
Quoting from the first page of Richard's "The Nearly Perfect Amplifier" in
the January 1994 issue of QST:
"According to Eimac, every 3% rise in directly heated cathode filament
voltage results in a 50% decrease in life due to carbon loss."
"Expressed mathematically, cathode life is proportional to [E1/E2^23.4,
where E1 is the lowest filament voltage at which normal PEP output is
realized and E2 is the increased filament voltage. "

To me, two things appear to be clear.
1. The person who asked the original question most probably did not read
the first page of "The Nearly Perfect Amplifier"---or did not read Eimac's

Care and Feeding of Power Grid Tubes.
2. The person who asked the question probably does not understand that (every 3% rise in filament voltage decreases emissive life by half) can be expressed algebraicly. Briefly, [1/1.03]^X=0.5. Find the exponent "X". The solution is X=23.4

Tom did not answer these questions:
1. How far apart are the transformer taps (in Ameritron amplifiers)?
2. Are the taps switch-selectable---or is disassembly required to change taps as the electric-mains (line) voltage rises and falls?
3. Can the filament voltage be measured without disassembling the amplifier?
4. Is a separate filament transformer used?

I'm guessing that the most probable answers are:
1. The taps are farther apart than what is indicated by the science.
2. No switch is provided---i.e., disassembly is required.
3. Disassembly is required.
4. No separate filament transformer is used.

IMO, not using a separate filament transformer is *poor* electronic engineering practice for the following reasons:
1. A single, do-all transformer precludes the possibility of using a rheostat to accurately control filament voltage---which is quite clearly the most critical voltage in an amplifier.
2. During heavy current demand from a capacitive-type HV filter, a substantive peak voltage drop occurs in the power transformer. If the amplifier tube's filament is powered by the same transformer, a substantive drop in peak filament V occurs during heavy current demand on the HV supply.
The Heath SB-220 amplifier used a separate filament transformer. Anyone who is familiar with Heath-designs knows that Heath did not waste money on anything that was not justified. IMO, Heath used a separate filament transformer for reasons that seem to have been overlooked by the person who designed MFJ/Ameritron amplifiers. This raises questions about MFJ/Ameritron engineering. According to a recent posting by Carl, KM1H, on the top-band contesting reflector,
"Another interesting bit of trivia is that the MFJ 3KW tuner caught fire in the ARRL lab. Not just once, but the replacement unit too. At under 1KW. It should come as no surprise that that small fact was missing from the QST review. "
IMO, anyone who chooses Delrin for a coil form material is ignorant of the fact that Delrin has a relatively high dissipation (D) factor. In the presence of moderate RF voltages above 10MHz, Delrin makes a great charcoal-igniter for the barbeque.

RE: the accuracy of filament voltage measurements:
I use a John Fluke 8022A to measure filament V. Even though this instrument is not true-RMS, for measuring sinewaves, I found that Fluke's RMS-approximator circuit provided pretty accurate RMS readings when I checked the 8022A against a NBS-tracable Hewlett Packard AC/DC voltage calibrator at the metrology lab where I was employed. At an

electric-mains voltage of 240v, I measured 5.31v at the pins of the 3-500Zs in my 922. Numerous other 922 owners have reported similar measurements. I also used the 8022A to measure filament voltage in Henry amplifiers. However, when I can read a newspaper by the light from a 3-500Z filament, I don't need my Fluke to tell me there is a problem.

However, IMO, it is unnecessary for owners of commercially-built amplifiers to measure filament voltage if they have an unlimited, free supply of new tubes.

The reports of high heater-voltage measurements in Command amplifiers came from one owner and one repairer. Making this measurement reportedly requires lengthy disassembly to gain access to the tube sockets, so few owners seem to be aware of the problem. The first clue that such a problem might exist came from a friend in Florida who repairs amplifiers. He telephoned to ask me what could be the problem if PEP RF output is normal on SSB, but RF output started decreasing steadily on FM and RTTY as soon as the amplifier was keyed? I told him that the only thing I knew of that could cause such a thing was barium migration from the cathode to the grid, which is caused by using more than the rated heater voltage. He telephoned me a couple of hours later and reported that the (3CX800A7) heater voltage was close to 15v.

I have not been writing about vhf parasite issues lately because am waiting for some vhf-Q measurements on the Ni-Cr-Fe alloys we use in our vhf parasitic suppressor retrofit kits. IMO, this could very well be the key issue in this discussion. Mr. Rauch claims that such alloys have high resistance at 28MHz and low resistance at 100-150 MHz. If this proves to be true, I will humbly conceed that Mr. Rauch is indeed one of our "recognized amplifier experts", as he claimed in QST magazine.

I'm still trying to figure out why Mr. Rauch cancelled his post of 28 November 1996. Forunately, this post is in Will's archive in case anyone wants to read it and take a wild guess.

Here we are in January already, and we still don't know who Eimac's Mr. XXX is. However, we should soon be hearing from Mr. Joseph P. "Buzz" Miklos who reportedly disagrees completely with me, but whose CV seems to disagree with Eimac's personnel records of his past employment.
----
e-mail copy to Mr. Rauch.

From: Gary Ritter <Highfrequency@msn.com>
Message-ID: <01bbf9ad$a39797a0$197b2299@default>
Source record: 99034

I am in the process of repairing mu Uncles rig...WB5GSG...I found several bugs
already ...receiver was very weak and meter was dead...found several resistors
burned through.
Still have two problems though.
The bias reads high but appears to be in the normal range using a voltmeter.
The major problem seems on 20M...Sidebands are out of whack...normally when tuning in a signal,I have the same rig but a newer version,sigs are tight
and narrow but on this one is very wide and can tune strong sigs. but weaker
sigs are tough to capture...by the time you tune it in the signal is very weak.
Heteradyne oscillator tunes fine,looking for .5 to 2.0 vdc, all tubes are good.
Can't find the cause...
Any assistance would be appreciated dearly...Uncle is retired and can't afford
to send the rig to former Heath tech.

Gary Ritter...N2EAL

85. Wanted: Plate Xfrmr for Gonset Linear Amp

Newsgroup: rec.radio.amateur.homebrew

Im sure he means +55dBMV; that is 55 dB above 1 millivolt at 75 ohms. The CATV amps and modulators are all rated in MV @ 75 ohms, although that can be easily converted to power at 75 ohms. Sorry, dont have my calculator handy.

Paul

Source record: 99037

More likely 55dBmV, which is 55 dB above 1 mVrms, which is approximately 0.6Vrms. Cable TV people express everything in dBmV. They also use 75 ohm
as the termination impedance. Your box will deliver 0.6 Vrms into 75 ohms.

It's a shot in the dark, but check the screen voltages. The high value
1/2 watt screen resistors of that era would go nearly open with no
visible sign, and the bypass caps would go short or leaky. ... KB4EG

89. Re: Pro & Cons on Cordless Telephone Headsets????

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-03 00:00:00 UTC
From: Rich Wall <richwall@asan.com>
Message-ID: <32CDDF62.7CC9@asan.com>
Source record: 99039
Cross-posted to: rec.radio,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

The pros are the obvious freedom of a cordless headset.

The cons are great, in my opinion.

1)You can be listened to by other cordless phones, scanners, baby monitors and other devices. This results in no privacy.

2) If you live in an appartment or densely populated community, you can hear other handsets or headsets using the same frequency or channel you are on.

3) The batteries in the cordless unit can die with little or no notice. Nicad batteries have a fast "drop-off" and the time spent off the charger is limited.

4) In some cases other handsets or headsets can capture your base unit's dial tone and dial out on your line. This problem has been resolved with the newer models using security codes.

These problems become more evident in apartment dwellings where the chances of other having a cordless close to yours is strong.

I hope this helps you with your concerns.

Rich

1) Check 6146's for being gassy. That can affect bias.

2) Mistuning of the coil slugs on 20m can create several different
problems that resemble your complaint. Also, check for
self-oscillation in one of the stages, e.g. RF amp. Make sure
all the tubes that are supposed to be reverse biased during
receive are actually off.

My friends have just moved into an apartment complex right next door
to a comercial FM radio station and are getting said FM signals in
thier telephones.

Any ideas on either a commercial filter or perhaps a homebrew ???

Thanks & 73's .... Roger N9PMC

97. CD-R Media for Sale

hello from Jim in Atlanta. All previous points correct,I've got some
experience with those too. I have found that the 900 mhz that use
spreadspectrum encryption work real well. You can be on hf running a k
with no rfi. The range is great,has the same charecteristics as our band
close by. Can be monitored,but they have to work for it! In my opinion
worth the expense. Good Luck KD4CDB

Hi Rick,

In article <5ai1n7$2eu$1@news3.microserve.net>, From yerke@csrlink.net
(Rick Yerke), the following was written:
> ,had quite a few 2 inch
> pieces of paper soda straw glued to the paper cone,about two inches up
> from the dustcover in a parallel circular pattern sort of like this
> ///// all around the paper cone.Does this somehow improve sound
> quality from the speaker?

That depends on what kind of sound you want.<g> The straws are
stiffeners that prevent breakup of that area of the cone. This improves
low freq response (keeps all parts of the cone in phase) at the possible
expense of muddy mid frequencies.

Better yet, why would a CD-ROM that costs about $.04 to make cost, what $20
more than the hard copy than the hard copy? Take a hard look at the 96 and 97
versions of the Handbook. Close enough that I'll save the bucks. The books are
probably within 5 pages of each other.
```

Your other point of the ARRL being infected with Windozitus also is true. There are a lot of DOS, Linux, and OS/2 users that just can't suck up that way.

[SNIP]

One thing that really bothers me is the misspelling of milliVolt as MV.
MV is 10^6 Volt, mV is 10^-3 Volt. It is only a 180 dB difference!

And of course the 75 ohm could just as well be 600 ohms....

Bart.

>
> Joe
> WA3CMQ

Alan:
More to the point:
55dBmV is 562mV. Power into the rated 75 ohm load is (E^2) / R, which
equals (.562)^2 / 75 = 4.2 milliwatts. This is considered high power
in the world of Cable TV.
You'll need lots of gain to get to the several watt level...about 30 dB!
Design for stability, shield well and, and good luck!

PS: Sorry I didn't take it to the final conclusion in my original post.

Hi there-

These are the tubes I m looking for. Most tubes would need to be new old stock, but some used types are OK when noted. n for new, u for used.

As far as pricing, depends on the brand/condition. This way I can pay top dollar and get the best stuff. Since I am looking for certain things to fill in holes in inventory, it will be substantially higher than what you will get from other dealers. Especially audio tubes. From 10% to double what Antique Electronic Supply and others will pay.

Or, I can trade if it makes sense. I also pay finders fees if you know where a stash is.....

Amen to that, Tom. I would toss the coax out the window onto the ground
at least ten feet from the house. Lightning travels on the *outside* of
coax. Since a lightning strike typically has many megavolts and many
kiloamperes, simply unplugging the coax may not be safe if the coax is
left inside the house.

And only hope your are home when threatening weather appears?
I have 15 coax lines coming into the shack, through the floor!

The safest bet is to properly ground the tower, provide tranverse voltage
lightning protection across HF antenna lines, and to ground all coax
cables at a COMMON point ground -- preferably at the AC service
entrance ground rod, before the cables enter the house, and at the
base of the (properly grounded tower). . This isn't
magic, it is part of the NEC. I also maintain a secondary common point
ground panel inside the shack, which is directly grounded to two outdoor
ground rods spaced 15 feet apart, which directly enter the first floor
shack
via #2 copper cables. All AC line protection devices, coax
shields (thru-panel barrel fittings) and phone line protection devices
are on this one panel. I also have a main breaker relay panel that
completely disconnects the AC power feed to the radios, ties all leads
together, and grounds them.

The trick is avoid any sort of a current path through the equipment in
the event of a nearby lightning strike. What is Voo-Doo and magic
is the copper bus bar being sold in the various ham magazines! IMO
such a device invites damage by encouraging a surge on the power line,
phone line, or AC service by forcing the return path THROUGH
the equipment the ground bus is supposed to protect!

Nothing is going to provide 100% protection in case of a direct hit,
but common point grounding can substantial avoid or reduce damage.

Message-ID: <32cfe700.801635@news.santafe.edu>
Source record: 98963
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.components

I am looking for the detailed dimensions of the mating face of a 1-5/8" EIA coax flange. In particular, the ID, OD and step height of the inner ring where contact is made. I have all of the other basic dimensions but these. I found the info by searching the net but so far haven't turned up the three numbers I mentioned.

I am also interested in buying small quantities of 7/8", 1-5/8". and 3-1/8" EIA coax hardware, hard line, flex line, el, flanges, unflanged couplers, directional couplers, etc. This would be for power test setups, so it doesn't need to look like new (but, it's ok if it does.)

>'224k' on a box marked .22uf. The latter made me think the
>relationship between the value and the markings was shaky.
>Can anyone shed any light on what I was seeing? - Mike

The markings are in PicoFarad. 103k would be 10,000 PF = .0
1 uFd.

224k would be 22 with 4 zeros = 220,000PF = .22 uFd.

The third digit is the number of zeros to add after the first 2
digits.

remember .1 uFd = 100,000 PF

A question for an experienced power amplifier builder. When using the 3-500z toward its maximum dissipation limit, Eimac requires a chimney assembly and and forced air cooling. If the CFM airflow is specified, how do you measure the airflow in CFM. Blowers are rated at some CFM, but I assume that is with no back pressure unlike the situation you would find forcing air around a tube. Is it better to measure tube envelope temperature directly since that is the parameter of interest. ?? Thanks, Dan

Sorry Bart, 75 ohms is the CATV standard. And I did spell out the word "millivolt", which does mean 1 X 10-3 in case you did not understand.

Paul

> 73 Tom
Thanks for the info Tom, I understand about the temp measurements but I
would want to be in the ball park as far a air flow before checking for
temperature. Is there a rule of thumb for initil airflow before powering
up the amplifier and making temp measurements. I would like to be close
as far as cooling goes initally. Wouldnt want to smoke the tubes :-)
thanks Dan

Rodger,

Check with K-Com (330-325-2110). Besides making phone filters to cover the Ham bands, they also make very effective ones for the AM & FM bands. I have been using them for years at our stations very effectively. If you are next door to the FM, you might want to contact their Engineer. You more than likely will be within their "Blanking contour". They may supply you with a filter free. At all our stations, we do this to keep the natives happy. It does a lot for public relations.

Ok, Scott. Here you go. The longest pin is the collector. The pin
opposite it is the base. The other two at 90 degree angles are the
emitters. See the drawing mod below. Are these still being made, or did
you just get a group of them surplus?

I didn't really look closely at the inductance issue. It may well be less of a problem than I thought. Although my output has fast rising edges the resulting ringing from a moderately inductive load won't significantly affect its ability to absorb energy. The real problem with heaters as a load is the change in resistance with temperature/power. My air cooled 2 kW load resistance increases 20% at full power (6 300W Carborundum resistors) abdt he power level drops 20%. This has been a problem, hence my interest in water cooled loads.

Thanks to all for their input.

Hi Scott--

The long lead is the collector (output end). The two leads 90-degrees either side of the long lead are both tied to the emitter (ground). The short lead opposite the collector is the base (input end). Hope this helps!

measures@mail.vcnet.com (R. L. Measures) wrote:
> Do the 1 and 5 KW MW transmitters have a step-start circuit?

No. And yes. The filament transformers were designed to be low capacity (like the heater transformer in the 30S-1) and to stand off 20 KV which meant that they were fairly high impedance devices. The starting current was usually less than twice the operating current.

>Did you try a different rheostat manufacturer after you became aware of
>the high rate of failure?

No. We've seen similar things in all devices which use carbon brushes and are not moved around (over their entire rotation) regularly. As another for-instance, there's the case of the variac brushes. We simply cannot use variacs for filament control unless the brushes are rated for at least twice the operating current. And Superior says that the brushes are already doubly rated. This doesn't seem to be true when the load is commutating--we can use variacs up to their rated current--but it is true when the load is resistive. No one has yet determined why the load characteristic makes a difference in brush survival.

That is not correct as indicated in a previous post. Taps are used.

>Commercial amplifiers rather typically have, a dedicated filament
>voltmeter with colored marks on the scale indicating the safe filament
>voltage range.
That's not true for broadcast or short wave transmitters. In thirty
years working on same I've never seen a safe-limits range indicated
with one exception--one TMC transmitter had a "normal" range
indicated.

>Flames are needed to light charcoal. Delrin plus RF =s flames.
Well, again that's not true. There are instances where the mechanical
strength of Delrin makes it the material of choice. The bandswitch
drive rods on our 100KW HF transmitter all all made of delrin. We
have never experienced a failure of the drive rods themselves unless
another fault induced excessive voltage on the rod. We've made over
100 of these transmitters and have had two or three rod failures over
twenty years.

>I rest my case.
I find it's best to make your case before you rest it. You can add
the suffix Esquire to my name if it helps even though I'm not licensed
to practice law on the internet--only in Louisiana and West Virginia.

==========

Although I'm an avid QRP, Homebrew, and Vacuum Tube buff, I'm not sure this
is the path I would recommend for an early project. Often times, the need
for a "unique" coil or capacitor will drive you crazy. Trying to find the
required power transformer and choke at a reasonable price can also be a
challenge. Likewise, there is some "buy-in" required to the world of
chassis construction; e.g., a decent drill (read "drill press") and some chassis
punching gear. VFO vs. XTAL also adds come complexities. And the legal
"Oh, by the way....." - some early rigs are a little "dirtier" than current
specifications recommend.

That said, grab any ARRL handbook from the late 50's or early 60's. The first
couple rigs in the High-Frequency Transmitter chapter are usually the simple
novice/QRP types. One of my favorites is the 6AG7 two-band rig in the 1957
Handbook. Uses a 5Y3 recifier. Perhaps, let yourselves be steered by the type
of parts you might have access to.

Barring that, TenTec and MFJ (as well as others) have some decent QRP XMTR
and RCVR kits on the market now. The TenTec $59.00 multiband regen receiver
is pretty decent and a nice heavy-duty construction kit.

Have fun - Dave K7HMP

>What measures are used to test for parasitics in a less
>destructive fashion?
You don't say what the nature of the output network is. I ain't sure you got a parasitic but it sounds like you need a better HV fuse. Maybe the tube is gassy and is arcing over at 6 KV--or maybe something else is arcing--something like the blocking or bypass cap. (Sometimes they arc over inside the ceramic where you can't see it. Usually a big bang will knock a chunk of ceramic out, though.) The violence of the event makes me doubt that it's a parasitic at all.

If I'm wrong and it really is a parasitic, one of the first steps is to sweep the anode circuit with a grid dip or an RF analysist to see where the spurious resonances are. Since output-to-input feedback is required for an unwanted oscillation, you shouldn't overlook the possiblity of coupling across the antenna switching relay(s) you're using.

> Richland, Wa.

Hi Vern,

I have built several of these and find them very useful around the shack. Since building the first one back in '78 or '79 I've acquired a couple of HP430's which have wider bandwidth and which don't give incorrect results with nonsinusoidal waveforms, but for general use I still rely on the square law detector.

I haven't really made any significant changes to the circuit. I have built them with chip or unencapsulated ceramic disc caps and better resistors for the input termination, to improve the response and match at VHF/UHF, and I've built them with slightly different biasing arrangements, but basically it's the same 20 year old circuit.

Instead of trying to increase the sensitivity of the detector, I just precede it with a broadband amplifier. Add a step attenuator and return-loss bridge and we're in measurement heaven!

This is the fairest, most honest way I have seen to share in the wealth of the world.!

Take five minutes to read this and it WILL change your life. If you want to know how to make thousands of dollars quickly, legally, and with NO CATCH, then keep reading.

The Internet has grown tremendously. It doubles in size every 4 months. Think about it. You see those 'Make Money Fast' posts more and more. That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, what's $5.00, I spend more than that in the morning on my way to work on coffee and cigs for the day. So I sent in my money and posted. Everyone was calling it a scam, but there are SO many new users from AOL, Netcom, etc. they will join in and make it work for you.

Well, two weeks later, I began receiving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, then BOOM. By the end of the fourth week, I had received nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking a similar chance with $5 of my own bucks. Not a big chance, I admit--but one with incredible potential, because $5 is all anyone ever invests in this system. Period. That's all Markus, Dave, or Dan invested, yet their $5 netted them tens of thousands of dollars each, in a safe, legal, completely legitimate way. Here's how it works in 3 easy steps:

STEP 1.
Invest your $5 by writing your name and address on five separate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill inside each paper, and mail them by standard U. S. Mail to the following five addresses:

1. Brian Truter - 101 N. Park Avenue - Springfield, IL 62702

2. J. Campbell - 1040 C Winners Circle - Bowling Green, KY 42104

3. Joost Walter - P.O. Box 259 - 2870-AG Schoonhoven The Netherlands

4. S. Thomas - P.O. Box 4945 - Tampa, FL 33677-4945

5. G. Del Buon - Horsekildevej 43 3 th - 2500 Valby - Denmark

STEP 2.
Now remove the top name from the list, and move the other names up. This way, #5 becomes #4 and so on. Put your name in as the fifth one on the list.

STEP 3.
Post the article to at least 250 newsgroups. There are at least 19000 newsgroups at any given moment in time. Try posting to as many newsgroups as you can. Remember the more groups you post to, the more people will see your article and send you cash!

STEP 4.
You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the Internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses. Yes, that's right, only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your name at #3 or 10,000 postings. Average return, 500 people= $500.

They make 250 postings each with your name at #2= 100,000 postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at #1 and you get a return of $60,000 before your name drops off the list. And that's only if everyone down the line makes only 250 postings each! Your total income for this one cycle is $55,000.

>From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through and repost this article everywhere you can think of. The more postings you make, the more cash ends up in your mailbox. It's too easy and too cheap to pass up!!!

So that's it. Pretty simple sounding stuff, huh? But believe me, it works. There are millions of people surfing the net every day, all day, all over the world. And 100,000 new people get on the net every day. You know that, you've seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. That's the key, and that's all there is to it. Print this out right now so you can refer back to

this article easily. Try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the bucks, and see what happens.

REMEMBER....HONESTY IS THE BEST POLICY. YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS! GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the bucks to the people already included, you will not get much. I know someone who did this and only got about $150 (and that's after two months). Then he sent the 5 bills, people added him to their lists, and in 4-5 weeks he had over $10,000!

140. Re: Vacuum Tube QRP Project

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-05 00:00:00 UTC
From: kresl@elknet.net
Message-ID: <MPG.d3a488e18b25f47989680@news.elknet.net>

Why Tubes? Building a TUNABLE tube rig is not something I would dive into as a beginner project. Power and thermal stability requirements will keep you very busy. Kit designers like HEATHKIT did make that an easy alternative, but this is NOW.

The HANDBOOK or QRP resource books will provide theory and plans on low power receiver and transmitter designs (as well transceivers). I have built several over the years, and my personal preference is for HARMONIC MIX transceivers that were popular a decade or more ago. DIRECT CONVERSION systems are cheap and fun, but prone to microphonic and hum pickup due to the high gain audio stages. Avoid.

The availabilty of NE-604 chip mixers make the possibility of good performing transceivers a reality, check the designs of Rich-K1BQT. The MFJ QRP rigs are his design, and having built my own version of it, provide a stable and affordable monoband transceiver (CW+SSB).

IMO the inductance would be the least of my concerns. Assuming the frequency was a constant 300kHz, the inductance could be easily measured and compensated for with a single capacitor. I would be more worried with some of the other suggestions regarding the use of heating elements for the load -- these might exhibit a large shift in resistance when heated.
I have seen AM BCB transmitter loads constructed using wire elements in a "toaster-like" configuration. They probably use reverse "windings" to cancel the inductive effects.

>73 from Ian G3SEK

Yes, that number looks ok for low current supplies Ian. I've asked for
data, and will look again.

Last time I looked was years back when the small caps first cap out. They
had shorter life specs than the type I favored using. I usually only look
at things when there is a reason, I hate changing to "better parts" if the
old ones never fail, hi. An unnecessary change has bit me rather hard on
the rear quarters more than once in my life.

My dad drove a tractor, he told me there was one important lever.

The best way is to measure the seal temperature.

There are various crayons, paints, and instruments available. If I can
help you with details let me know.

Message-ID: <19970105011700.UAA05883@ladder01.news.aol.com>
Source record: 98974

Hi Rich,

This newsgroup is chartered for the exchange of technical information, so I'll respond to the things that may be of general technical interest. I'll ignore the pathological non-technical comments.

In article <measures-0301971716380001@port10.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:

>1. How far apart are the transformer taps (in Ameritron amplifiers)?

I'm going to assume you mean in volts, or percent. It depends on the PA. The AL-8 series (AL-800, 811, 80B, etc) allows the selection of 10% step taps in the less expensive amplifiers (like the 811).

When this series is used with more expensive tubes like 3CX800's, voltage is adjustable in 4% steps. The 3CX800 is rated at 13.5 volts + - .6 volts, that's about 9% allowable delta. This allows the customer to pick a voltage close to the center of the normal rating.

>2. Are the taps switch-selectable---or is disassembly required to change
>taps as the electric-mains (line) voltage rises and falls?
>3. Can the filament voltage be measured without disassembling the amplifier?

Two and three are the same question. No, there is no external control. I think an external rheostat is a bad idea, even though it is cheaper than adding windings.

>4. Is a separate filament transformer used?

It depends on the PA and the tube requirements.

>I'm guessing that the most probable answers are:

I think it is wrong to publicly "guess" something, and then leap to a conclusion your guess is a fact. But I'll answer anyway.

>1. The taps are farther apart than what is indicated by the science.

It appears not, when I review the data. So far as service history, and to the best of my knowledge, the only PA's ever received with low emission tubes had YOUR modifications in them.

Again I ask, how many readers have had tubes go flat from excessive filament voltage? So far Rich, we have ZERO reports of emission related failures in the Command, Ten Tec, and Kenwood amplifiers you are bashing.

>2. No switch is provided---i.e., disassembly is required.
>3. Disassembly is required.

Two and three are the same. I don't like your idea because it makes it possible for someone to accidently crank the filament voltage up or down too much from the outside. A rheostat also could fail, and cause the immediate loss of metal oxide cathode tubes. The general rule is to NOT add complexity unless advantages outweigh potential problems.

Since you offer no emission failure case history data, and since my direct experience with the sale of over 30,000 amateur PA's and several thousand commercial PA's indicates emission life is NOT a problem for amateurs, I feel your suggestion is ill-advised.

Nearly every amateur (and many commercial) user is not equipped to determine the proper filament voltage setting. Most customers are best left with fewest number of adjustments possible.

>4. No separate filament transformer is used.

Incorrect.

> IMO, anyone who chooses Delrin for a coil form material is ignorant of
>the fact that Delrin has a relatively high dissipation (D) factor.

I agree. That was an idiotic choice of materials.

>In the
>presence of moderate RF voltages above 10MHz, Delrin makes a great
>charcoal-igniter for the barbeque.

That is not true at all.

>However, when I can read a newspaper by the light from a
>3-500Z filament, I don't need my Fluke to tell me there is a problem.

That certainly sounds colorful, but it is a needless and meaningless story.

>The reports of high heater-voltage measurements in Command amplifiers came
>from one owner and one repairer.

That's second hand information and is totally dependent on a unknown person's equipment and skill. If it is true, Commander needs to address that problem.

But we should ALL be cautious in accepting data relayed from a source who has proven himself unreliable several times. I have no opinion one way or another until I can hear or see such information presented by a reliable source.

> I have not been writing about vhf parasite issues lately because am
>waiting for some vhf-Q measurements on the Ni-Cr-Fe alloys we use in our
>vhf parasitic suppressor retrofit kits. IMO, this could very well be the
>key issue in this discussion. Mr. Rauch claims that such alloys have

high
>resistance at 28MHz and low resistance at 100-150 MHz.

I never claimed the allows have a high ressistance at HF, and a low
resistance at VHF. I simply claimed your low Q VHF nichrome suppressors
mainly reduce HF Q.
I said the change in VHF Q by adding nichrome was unimportant, because the
resistor dominates the system at VHF, not inductor losses.

Please post a copy of where I said "such alloys have high resistance at
28MHz and low resistance at 100-150 MHz." If I said that, I will correct
it.

>If this proves to
>be true, I will humbly conceed that Mr. Rauch is indeed one of our
>"recognized amplifier experts", as he claimed in QST magazine.

I never called myself that in QST, so your claim is untrue..

QST did "call" SEVERAL people experts however. I guess I was mentioned by
them.

Variable rheostats were used on our 1 and 5 KW MW transmitters which used thoriated tungsten filament tubes. The Rheosats (as you would expect in commercial equipment of this calibre) were adequately rated with a 2:1 safety factor on current rating. Our field failure rate was quite high after the transmitters had been in service a few years. The carbon contact point just ate the rheostat winding over time which, in turn, would open the filament primary circuit and take the transmitter off the air. It is more difficult--and more expensive--to use tapped filament and power transformers. (You can easily double the cost of a transformer in providing 2% taps.) But that's all we use now. One interesting approach would be to use SCR control on the filament/heater voltage. The only problem is that such complexity doesn't make economic sense in amplifiers with the tubes of the size we're discussing here.

**Virtually all commercial amplifiers use a rheostat or a Variac to
continuously adjust filament voltage. If a commercial amplifier
manufacturer produced an amplifier without a means of continuously
adjusting filament voltage, it is unlikely that any knowledgeable engineer
would recommend purchasing such an amplifier.

> >4. Is a separate filament transformer used?

Bzzzzzzzzzzzzzzzzzzzzzzzzzzzzt. Good thing I picked up some more batteries.

In the various notes that come with the low VHF Q parasitic suppressor
retrofit kits, I advise owners to measure filament voltage while they have
their amplifiers apart. If the measured voltage is not within Eimac's
rated filament voltage range, corrective steps need to be taken. IMO,
5.9v on a 3-500Z or 8877 filament (Eimac rating: 4.75v-5.25v) is not good
engineering practice---and yet there are at least four such amplifiers.
Of course, if you have a different opinion, Mr. Rauch, I support your

right to that opinion.

> Again I ask, how many readers have had tubes go flat from excessive
> filament voltage? So far Rich, we have ZERO reports of emission related
> failures in the Command, Ten Tec, and Kenwood amplifiers you are bashing.

To the best of my knowledge, Ten Tec has no such problems. Command and
Kenwood do. Translation: "bashing"=s telling the truth about the
measured filament voltage. // "Failures" are not caused by excessive
filament voltage. Loss of emission is basicly a slow---or not so
slow---process. Even with 6v on a 5.25v-rated max. filament, the tube
should last a few hundred hours. However, for most hams, this would still
be more than the typical 12 month warranty period on ham amplifiers.
>

ROFL. Maybe we shouldn't have bandswitches because we can accidentally
set them on the wrong band. Are customers drooling idiots?

Commercial amplifiers rather typically have, a dedicated filament
voltmeter with colored marks on the scale indicating the safe filament
voltage range. (See ** above.)

> >4. No separate filament transformer is used.
>
> Incorrect.
>
Does Mr. Rauch tell us which models have a separate filament transformer?
Hmmm. How many times did I ask Mr. Rauch whether or not the AL-1500
(8877) amplifier uses a VHF parasitic oscillation suppressor?

> >In the
> >presence of moderate RF voltages above 10MHz, Delrin makes a great
> >charcoal-igniter for the barbeque.
>
> That is not true at all.

Flames are needed to light charcoal. Delrin plus RF =s flames. Nylon and
vinyl work even better.

> >However, when I can read a newspaper by the light from a
> >3-500Z filament, I don't need my Fluke to tell me there is a problem.
>
> That certainly sounds colorful, but it is a needless and meaningless
> story.

With 6 volts on a 3-500Z's filament, the light therefrom is sufficient to
read a newspaper. Is loosing 99% of a tube's potential emissive life
meaningless?

...snip...

> >If this proves to
> >be true, I will humbly conceed that Mr. Rauch is indeed one of our

B&W is still in Business in Bristol, Pa. The telephone number, as of a few months ago, was 215-788-5581. The catalog does list alot of coils, including a couple of tank circuits, one of which will handle a thousand watts, although I do not see a model 850.

When I went to work for Raytheon in 1963, the Sparrow missle used subminature tubes with wire leads, mounted in spring clips. The wire leads were hand-soldered to the circuit board. A few years later, the Sparrow missle was converted to use transistors. It was rather difficult to design transistor circuits that would operate at the required temperatures. However, the old subminiture tubes had no such problems. At one point, Joe Reisert, the chief engineer said that if we had been using transistors all along, and some salesman came in and demonstrated a new high-temperature environment amplifying device called the subminature electron tube, it would have been hailed as a technological breakthrough.

Fred: Do the 1 and 5 KW MW transmitters have a step-start circuit?

I use a rheostat to control the filament voltage in my 8169 Class AB1 amplifier. I have experienced no such failures in this 9 year old amplifier. The safety factor on the rheostat is less than 50%. The brush material is graphite. The resistance material is nichrome wire.

Did you try a different rheostat manufacturer after you became aware of the high rate of failure?

:>
:>Any ideas would be appreciated.

Neil (and others who have been asking about replacement transformers),

Check the Peter W. Dahl site at "www.pwdahl.com."

In the case of the Gonset GSB-101 I find:

GONSET GSB-101 ER PLATE C EXACT REPLACEMENT UNIT WITH 117 VAC PRI EI-175 X 5" 29G M6X 04 31 $195.00 PR) 117 VAC 60 HZ 1 PH S1) 3600 VCT @ 500 MA CCS DM) HT = 5.250 WT = 4.375 DT = 7.205 MD = 6.125 MW = 3.500 WT = 31.1 LBS
==========
==
GONSET GSB-101 ER PLATE J EXACT REPLACEMENT UNIT WITH 220 VAC PRI EI-175 X 5" 29G M6X 04 31 $195.00 PR) 220 VAC 60 HZ 1 PH S1) 3600 VCT @ 500 MA CCS DM) HT = 5.250 WT = 4.375 DT = 7.205 MD = 6.125 MW = 3.500 WT = 31.1 LBS

These are exact replacement transformers in either 115 Volt or 220 Volt primary versions. The secondary is rated at 3600 Volts @ 500 mA CCS (Continuous Commercial Service) so should be easily able to provide 600 or 700 mA peak ...

Dahl has exact replacement transformers for most amateur amplifiers, higher capacity retrofit transformers, as well as transformers for many of the ARRL/Ham Radio/CQ magazine/Handbook modification articles and construction porojects.

It is possible to build 20kV-insulated transformers that have low copper loss and low hystereses loss--i.e., that exhibit low Z. // "Usually"...? Did anyone measure the peak startup current through the rheostat brushes with an oscilloscope?

I would have been tempted to spend a bit extra on a graphite contact brush as opposed to a less-costly carbon contact brush. Using Kanthal® resistance wire, as opposed to nichrome resistance wire, might have helped. Perhaps a better solution would be to use a Centralab 9000 series 18-position shorting-contact switch, with an appropriate resistor between adjacent contacts. These switches use silver-plated contacts, so there are potentially no dissimilar contact material problems. Since the most common silver compounds, silver oxide and silver sulphide, conduct almost as well as silver, environmental problems should be minimal.
By using two such switches in series, 324 increments of adjustment can be achieved.

I believe this scope is one that had a separate power supply chassis. It provided B+,filaments ,etc. It should have been provided with the scope. Tek made a couple of tube scopes with separate p.s. because they used so much power and space. I suggest that you put your money and effort into a solid-state scope like a 465.

However, as I understand it, the files/documents on the CD in question are
images, not text. HTML is text. Converting a magazine page to text
requires a scanner, an OCR app. like TextBridge, and *MUCH* time spent
copy-editing. I published a 210 page out-of-print book on the Internet
and it took at least 80 man/woman hours.

I am in the process of designing a remote antenna switch for 8 antenna's with MOV protection on the input lines. 5 of the connections are for 5 quad loops and the others are for dipoles for 30/40/80 on the tower.For lack of a better source, I have always used the 10 amp 12 volt DPDT Radio Shack Relays in sockets. It takes 4 for this arrangement with up to 3 contacts in series which I do not like (all suggestions appreciated here). I have always used the 6 position Jones plugs for connections (anyone know of a better or less expensive connector) or just a terminal board.

Does anyone know a good inexpensive source of high current MOV's (to protect the control lines against lightning). Is there a source for brass (non-rusting) SO-239 connectors for the antenna connectors?

Does anyone have any experience in bringing a bundle of 5 to 8 RG213 (RG8) coaxes past the rotator? (Also have some vhf antennas above this). If this is a real problem, then I may have to split the antenna switch and that is more complex.

Hello Hans,

Several others have suggested using the 74HC240 instead. For an example of a complete CW transceiver using this chip as the "final", check out the 38 Special at <http://www.fix.net/norcal.html>.

Fred Riley is involved with commercial transmitters, and has confirmed my opinion and experience. A rheostat could only have been suggested because you fail to understand the problems it creates.

This has once again become a "let me pick to death anything anyone else does" thread. You've ripped up QST, ETO, Commander, Kenwood, Heathkit, Ameritron, Ten Tec, and on and on. You even rip up your own family, saying pathological liars run in your family and you have to "check out" anything your own family members say!

Rich, there is no point in continuing this. You apparently have no more technical points, and a slander campaign generates little support for anyone participating.

>>dielectric does matter - but in practice it's always PTFE in Ns and
>>BNCs.
>
>Here comes some humble pie..
>The dielectric constant for PTFE is about 2.1, the square root around
>1.5. About the same ratio as 50:75! (munch, munch...)

If you peek inside 50 ohm BNC's, youll see a solid dielectric.

If you peek at the 75 ohms, you'll find air!

Same size pins and internal leads in both.

If you peek at the end of a 75 ohm N youll see a thin pin, and thin leads. With a 50 ohm N youll see thicker leads.

Plug a 50 ohm N male into a 75 ohm female and you've ruined her for life. Plug a 75 ohm male into a 50 ohm female and the mating is poor.

I like Big Nose Chuck's idea better!

>I guess this is how folklore starts...
>Thanks for the discussion folks.

I know a guy who changed his ~35 ohm UHF SO-239's/259's to 75 ohm N's (he picked the N's that were more expensive on a price list, he thought they were better) to improve his SWR on 30 MHz and down. He thought the so-239 connectors had .1 dB loss per connector, and when he was done he swore it made a big difference!!!!.

That's where folklore usually winds up. hi.

I don't have the Eimac data sheets here at home but I will try to
remember to look at work tomorrow. I know that what they ask is that
you use their air system socket and chimney and a fan that produces a
given pressure drop between the inside and the outside of the chassis.

I believe that they recommend ~0.3" of water as the pressure. This is
actually easy to measure with a small length of 1/4" clear plastic
tubing. Just push one end in a hole in the chassis and leave the
other end out. You may need to insert the other end somewhere it will
see a pressure that is the same as the chimney exit. Fill a few
inches of the tubing with water and let it form a loop with the water
at the bottom. The difference in the water levels is the pressure
difference between the two ends of the tubing in inches of water.

I posted material some time ago regarding the Webb Laboratories Education & Professional Partnership Programs, unprecedented opportunities through which every faculty member, graduate student and undergraduate student (alternatively for the PP program - each member of a working group of designers) can achieve true ownership, at school, home and on the job, of powerful electronic CAE capability. The EP and PP Programs provide general, graphical nodal circuit analysis, RF/microwave-specific analysis, unconstrained nodal noise capability and true 'floating' two-nodes-per-port definition. In addition, the EP and PP Programs include the industry's most comprehensive transmission structure analysis/synthesis engine as well as the powerful SystemPlus suite of design tools for the wireless/receiver/system designer.

The complete EP or PP Program package, including over 500 pages of documentation, may be distributed department/group/consortium/company-wide with no restrictions, without expiration, and at no liability to the School, Group, Consortium or Corporation. EP/PP Program details, an editorial review and a growing example library may be found at:

http://www.webblabs.com/ep.htm

or

http://www.webblabs.com/pp.htm

I ask that you forward this announcement to potentially interested individuals. If you prefer, kindly reply with names and e-mail addresses of those to whom I should convey information directly. Thank you for taking the time to consider what has become a unique access and ownership opportunity for a great number of designers worldwide.

Wishing you a Happy New Year!

The problem with the FCC pre-emption isn't that it exists, but rather that it doesn't go far enough for hams. Note that your quote doesn't in any way benefit amateur transmit or receiving antennas. To be blunt, a pre-emption would have to specify amateurs or state that all antennas below a certain size were covered. I also note that many satellite dish owners won't benefit, as a one meter dish isn't all that big, although it will allow adequate reception of many of the DSS services. It won't however even offer adequte reception of audio services of satellites, so picture reception of the few unscambled services won't be affected either. 73 de n8blk/3 -art clemons-

187. Alternative to Chassis Punches

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-06 00:00:00 UTC
From: gsparks@ix.netcom.com
Message-ID: <5ard99$mi8@dfw-ixnews7.ix.netcom.com>
Source record: 98938

I found a very acceptable alternative to chassis punches at a pawn shop a few years ago.

They are pipe reamers for steel plumbing pipes, they are 8 fluted tapered reamers, I have 2, on braces (hand drill's), the first goes from 3/8 to about 1", and second goes from 3/4 to about 2". I drill a 3/8 hole, and just hand ream to any size in just a few momemts. I don't know the real cost of these, but I picked them up for $10 for the pair and one brace. I have a few chassis punches, but I tend to use these almost always.

189. Need: Output Z of pair of MRF-150 FET's

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-07 00:00:00 UTC
From: philk5pc@connect.net
Message-ID: <5asofl$3p8@dallas1.connect.net>
Source record: 98842

I am trying to put a Collins PA-2000 amp on the air. It has a FET driver module (pair of MRF-150's in the final) that I want to replace with my 100w transceiver. I need to construct a transformer that will match the 50 ohms from the transceiver to the 4-port combiner that feeds the finals (4 modules of 2 transsitors each, MRF-448). The transformer must be broadbanded, 1.8-30 mhz.

I hope someone has been down this road and can help me with a transformer design. Thanks! (((73))) Phil, K5PC

>

Got my TDS220 from Allied Electronics. Credit card, 2nd day air UPS, no probs.

Nice scope, excellent value, especially compared with state of the art 10
or even 5 years ago. Only gripe is that there is some sampling noise
evident at around 3 mV p-p on max BW without display averaging.

Although the BW is claimed to be 100 MHz, mine gives useful response
beyond 200 MHz. The joys of real time 1 GHz sampling.....

Also, despite PR, you will still need an analog scope. Display of a 10 MHz
carrier with 1 kHz AM is unconvincing.

Best,

Peter

Hi Rich,

I came in on this discussion late, but was just wondering if
you've attempted to solve parasitics by other means? Reducing
the Q of the tank across the entire range of operating
frequencies seems self-defeating, particuarly when there are
alternate methods.

Have you measured the increase in harmonic output in the
amplifiers you've modified?

Sounds like the USB BFO may not be at the right frequency. If
it's too far outside the passband of the filter, "zero beat"
will result in the attenuation you've described.

Have you got a working/knackered FM transmitter,
preferably something high power?
I'm actually trying to locate a burnt out FM valve PA cavity chassis.

Any help to:

A while back there was someone selling replacement caps for the
MLA-2500 Power Supply. 100-150 uF @ 450 Volts.

Does anyone remember who was selling them or know of a source? I do
know that caps in this size/voltage are difficult to buy.

These are for a good friend of mine.

Any help appreciated!

Really. All it takes is an inverse log function. +55 dBm = 316 W.

Quite an output - lossy cable perhaps. Are you sure about the output?

+55 dBuW is plausible, as is 5.5 dBm, -55 dBm, +55dBuV, +55 dBmV?

Hi Jim,

In article <5as2jd$c3c@news.doit.wisc.edu>, mgkepner@facstaff.wisc.edu (Melissa & Jim) writes:

>I don't have the Eimac data sheets here at home but I will try to
>remember to look at work tomorrow. I know that what they ask is that
>you use their air system socket and chimney and a fan that produces a
>given pressure drop between the inside and the outside of the chassis.

They really don't care what system you use, they only require airflow be enough to insure seal temperatures below 200 degrees C and envelope temperatures below 225-250 C.

>I believe that they recommend ~0.3" of water as the pressure. This is
>actually easy to measure with a small length of 1/4" clear plastic
>tubing. Just push one end in a hole in the chassis and leave the
>other end out. You may need to insert the other end somewhere it will
>see a pressure that is the same as the chimney exit. Fill a few
>inches of the tubing with water and let it form a loop with the water
>at the bottom. The difference in the water levels is the pressure
>difference between the two ends of the tubing in inches of water.

That's way too much air. Pressure drop is .082 inches of water from below the base air entrance to the anode area exit.

The correct way to determine if you have a problem is to measure the temperature in operation. You can do this by using temperature measuring crayons from Tempil.

Tempil sells indicating markers at 908 757 8300, crayons are $8 each, I use them here. 3-50-0Z seal temperature ratings are 200 degrees C for the base, and 225 c for the anode seal and envelope.

Cooler temperatures will reduce seal and glass fatigue. Seal leakage is the number one cause of failure in properly manufactured 3-500Z's. The result is a tube with gas, producing arc-overs when high peak voltages are applied. This is sometimes blamed on parasitics or inrush by people who are inexperienced in the cases of tube failures.

Hi,

We would like to take a minute of your time to inform you of our new Electronics Resource Directory, a free, comprehensive listing of over 500 Web sites of interest to electronics enthusiasts and engineers.

The Directory is available on our web site at:
http://www.netins.net/showcase/elab

If you have an electronics-related web site and would like to add a link to our resource directory from your site, just cut-and-paste the following HTML into your page's source code:

This will place an attractive 'Electronics Resource Directory' logo onto your page that will hot-linked to our Directory for your and your visitor's convenience and use.

We thank you for your time and hope the Electronics Directory will be useful to you. Please let us know if you would like a free listing for your page in our directory!

In that other thread, Tom W8JI wrote in response to Rich AG6K:
>
>> IMO, anyone who chooses Delrin for a coil form material is ignorant of
>>the fact that Delrin has a relatively high dissipation (D) factor.
>
>I agree. That was an idiotic choice of materials.

At about the same time, W8JI had responded to a request on the TowerTalk reflector for information on the MFJ-989 ATU. It casts more light on the Delrin problem and on the origins of the "3 kW ATU" rating.

Over to W8JI (reproduced here with permission)...

Subject: Re: MFJ-989 antenna tuner comments review

I'm an independent RF designer. I started going through the MFJ tuners about a year or two ago. I feel insight into engineering facts is important. People should understand a few things about tuners in general, and the 989 in particular.

I've yet to find any tuner (except the ATR-15 as advertised by Ameritron in the 80's, and the old EF Johnson KW Matchbox) that always met power specifications as advertised. The ATR 15 was rated at the RF output power over a specific load impedance and frequency range, and the KW Johnson Matchbox was rated for a 1 kW AM transmitter (about 750 watts continuous carrier and 3 kW PEP modulation peaks, so it easily handles 1500 watts CW or PEP output).

Power ratings for tuners are an offshoot of when PA's were measured by plate INPUT power. For example, the SB-220 (I am a former RF consultant for Heath-Zenith) was advertised as a 2 kW PEP Input Power PA, but the SB-220 was really a ~1kW SSB PEP and 600 watt CW output PA. The matching tuners were called "2 kW tuners", because they went with 2 kW PEP INPUT POWER PA's.

Enter Dentron. They called their PA's "3 kW", even though they only put out the same reliable power as the 220. Likewise Dentron called their matching 600 watt CW output tuners "3 kW tuners". That rating of "3 kW" has since become attached to any tuner of the same basic quality components as Dentron's, and it seems to have stuck.

So, a typical so-called "3 kW tuner" is actually a 600-700 watt CW (1200 watt PEP SSB) tuner by today's OUTPUT power standards.

The MFJ 989 used a roller produced by Oren Elliot Products. It is an industry standard roller, and is similar to or the same as rollers used in high dollar tuners. Unfortunately, the Oren Elliot roller has a

Delrin form, but it is the overall roller design that seriously lowers the power rating. Roller Q is absolutely NOT a problem of cabinet size or anything external to the roller, it is a problem of materials used in the roller and the basic roller design.

Even the expensive ceramic form roller from Cardwell barely offers an improvement. It has almost the same loss, but the ceramic form does stand heat much better. The new design air coil roller used in the MFJ 989 helps to solve Q and heating problems, and the manual was also re-written to correct misinformation on how to adjust the tuner for the lowest matched loss.

As for power ratings, it is NOT correct to specify a power rating without specifying both a load impedance and a frequency. ANY manufacturer who says "this is a 3 KW tuner" without being band and load specific is just howling out a number that may not - and probably will not - mean anything to you. The only way to know for sure if a certain tuner will work is to try it with your own antennas.

T network tuners (like the 989, Xmatch, Vectronics, Tucker, Murch, etc) handle the least power on 160 and loads of low resistance and high capacitive reactance. T network tuners handle MORE power into higher resistance loads or loads with some amount of inductive reactance.

In a T network tuner, maximum efficiency and power handling generally occurs with maximum and equal amounts of capacitance, and the least amount of inductance is used. This is true even though many other settings will produce a low SWR.

L network tuners (like the Ten-Tec, Nye Viking, etc) handle more power into impedances near 50 ohms, but often do a poor job matching reactive or very low impedance loads on low frequencies. (Sometimes these tuners are called Pi-networks, even though they do not really function as a pi except perhaps on 15 or ten meters.)

I hope this dispells some of the hyperbole about tuners.

Ah, good; you _are_ out in the open.

>I would be pleased if you were able to see that[the universe is alive].

I can see that it might perhaps possibly be so. To state that it IS
alive is conjecture. (Unless you can prove your statement.)

>On the other hand I wonder if you are actually able to see that as clearly as we are able
to
>see how disingenuous you are?
>
>>And thanks for setting us straight about Dr. Sagan. I guess we were
>>all deluded by the more than 200 scientific papers, the decades of
>>productive work on the Pioneer and Voyager missions, and the teaching
>>at Cornell.
>
>You are welcome. Yes, this much is evident. When you don't love the
>truth you are easily deluded. Sagan and others are (were) richly rewarded
>by the prince of this world for leading many astray.

I don't think my message was disengenuous. But since you do, let me
state my position plainly: Sagan's statements describe things that
can be tested, and thus proven (or disproven). Your statement cannot
be tested this way. That doesn't make it either true or untrue --
just unprovable, and therefore conjecture.

Furthermore, I don't agree that Dr. Sagan was, in your words, "leading
many astray." He might have been leading them away from some belief
system that you happen to value, but I doubt I would agree that this
is something which (as you imply) deserves punishment.

206. help with MC1350

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-07 00:00:00 UTC
From: Zack Clobes <zclobes@southwind.net>
Message-ID: <32D30A94.7696@southwind.net>
Source record: 98859

I'm working on a 20M SSB receiver and I'm working on the IF amplifier. I chose to use the mc1350 because of it's simplicity. I built a circuit that used a capacitor coupling on the input and the output came out on pin 1, through a xformer, and to the +vcc. I was unable to get the amplifier to amplify so I ended up tearing it down and rebuilding a simpler circuit. The new circuit is a 50ohm source, coupled directly into the chip with 2 caps. The output is simply a 1K resistor from pin 1 to ground.

According to a 10K pot and the Oscope, a 1K load seemed to be the best match to the chip. Does this agree with other people's findings?

Why does most every schematic with the 1350 in it have the output of the chip with a DC path to +vcc. Why is this? The chip seemed to work just fine with a 1K to ground.

I didn't do any more testing past the 1K resistor. Are the two output 180 out of phase? Are there any advantages of tieing the two outputs through a xformer? What would the output Z be if they were together?

Motorola's web page has been of little help with this chip. I assume that it is about outdated and they have very little info covering the specs. Any help would be appriciated.

From Tim;
The TEK 551 (dual-beam) should have a *seperate* power-supply unit, which
is connected via a cable to that 16-way plug on the 'scope. The EHT for
the CRT is generated inside the scope itself, but the other voltages are
provided by the power-unit. If you don't have this, then it's :-(
unless you can find one.

Since my old message became dislodged from somewhere
(not by me) in the year end floods, let me say thank you to
all the helpful replies I received (many by e-mail).

My question was:
>What measures are used to test for parasitics in a less
>destructive fashion?

Using a few series resistors in series with the plate supply fuse,
seems the easiest way to avoid loud bangs. I had mistakenly
read the advice as a fuse or series resistors, when both in
series seems to be the sage advice.

In response to Fred, W8OY:

Thanks for your thoughts on what may have been the actual problem.
My problem was that I so disliked loud bangs, that I "fixed"
several possible problems all at once, and don't know what really
happened. I have never had a problem while operating, just
while "testing" with the variac to sweep up the plate voltage.

Jf> You don't say what the nature of the output network is.

Pi-L.

I ain't sure
Jf> you got a parasitic

Neither am I, actually. Since I fixed it before knowing what the
problem really was.

Jf> maybe something

Jf> they arc over inside the ceramic where you can't see it. Usually a
Jf> big bang will knock a chunk of ceramic out, though.) The violence of
Jf> the event makes me doubt that it's a parasitic at all.

Very good interesting guess.
The bypass cap. was shorted. So I replaced it with a cap with a
much higher voltage rating. What I don't know, is if it was
the DC voltage, or AC from a parasitic, that caused it to go.

Jf> Since output-to-input feedback is
Jf> required for an unwanted oscillation, you shouldn't overlook the
Jf> possiblity of coupling

I did improve input/output shielding also.

Thanks for your thoughts, Fred.

>If this post has been sent to wrong place I am very sorry

For what? All of us have to start somewhere! You have arrived in the friendliest place in the world, ham radio. Sort of like Internet without wires! <Huge grin>

Once you discover what all this is about, you may embark on a lifetime of discovery. At 44 years into this thing, I am still having fun and, for the most part, the people in it are WAY above average folks.

>Could anyone explain to me what is packet radio, amateur radio and the
>difference between them.

Amateur radio is the permitted use of a relatively large part of the radio channels by individuals who do not have to pay for the right to use the channels. If you look at your broadcast radio, your FM radio and your TV set, you will see they are marked in channel numbers. Never mind about the meaning of that, right now, just discover here that there are MORE channel numbers above and below and between those that you see!

Many, many more. Whole sections of the channels are used by different people for different things! Police, fire people, constuction crews, people sending I love you messages from a cruise ship - they ALL use these other channels and MOST of the time they have to get a LICENSE from the government to use one or more of them.

Hams have to get licenses too. However, the hams use whole chunks of channels. Each chunk has different characteristics. Some chunks can be used to talk directly from Podunk, Texas, to Sydney, Australia, direct! On a good day, you can do that with the power of no more than a FLASHIGHT!

Imagine that, shining a flashlight up in the air and having it seen in Australia! Not only that but your little flashlight can be seen by THOUSANDS of people, all over the world at the SAME TIME! And, its all for free (well, not the cost of the flashlight or the very little for the paper work of the license), totally free, any time of day or night, just holler hello!

It is a priceless, fascinating hobby.... MAGIC that even David Copperfield cannot top.....

Now Packet Radio is a form of radio that packages up blocks of text and numbers into small groups within a larger message. It uses the radio channel to communicate these chunks of text to someone else, and while it is doing it, it makes sure that the chunk was received correctly at the

other end of the circuit. It is just one of MANY forms of amateur radio, but note... it isn't used just by hams. It is also used by fire departments, astronaughts in space... you name it.

>What sort of equipment do I need

A transmitter and receiver that operate upon a channel or set of channels that can be used with a similar type setup on the other end. Cost can be very little or LOTS. Like dogs, or most anything else, some dogs are bigger than other dogs. Ham radio is competitive and the my dog is bigger than your dog deal exists here too! That's part of the fun! It leads to CONTESTS!

There, a well trained little dog can often bite the heck out of even far bigger dogs... expererience and dedication count, just like other sports.

>Does it work worldwide or do I have to be within a distance of (say a tower >or station)

All of the above!

You may talk direct from you to someone else, or go through what we call a repeater station to help you.

Either way, your station uses an antenna. You buy or build your own antennas, some of which need be no larger than a foot or less in size, to HUGE ones that can require towers more than 200 feet high with wire lengths of 2400 to 4000 feet long.

The controlling factor for the tower and antenna size is the channel area. Some channels take bigger antennas than others.

Owning a St. Bernard can be a chore... Using the channels that require the huge antennas above takes space only found out in the country, but there are TONS of channels that can be carried around in your hand or pocket!

<smile>

All dogs are welcome!

>Anything extra would be very valuable

Yes indeed. Go to Radio Shack or a book store or a library and look us up! Your local library is a fine place, or in any event, one of several books you can thumb through is "Now You're Talking", published by one of the fraternal organizations in the hobby called the American Radio Relay League.

If you take it home, the chances are you will be started on this stuff!

In even most smaller cities or even out in the country, chances are someone will know of a "ham operator." Seek the person out, guys and gals abound in this thing!

The rest is all MAGIC!

>pls drop me email direct

Not really. I hope I've answered it in such a way that you will come back here or seek the area that will let you start this fascinating journey!

>Thanks in advance

What he said: It works like resistor color code bands, digits 1 + 2 are
significant; the third digit is a multiplier (number of zeroes to add)
so we get: 104 = .1uf, 103 = .01uf, 102 = .001uf (1000p), 101 = 100 pf,
and
100 = 10pf. Values marked with a "p" suffix are usually that exact
marked
value i.e. 47p = 47pf.

Pardon me for jumping in, but I don't think it can be argued that Sagan did sometimes lead people astray in the sense that he sometimes played fast and loose with the facts. He often put on the airs of having much more expertise than he did, particularly in areas outside astronomy, sometimes committing blunders such as calling a fish an invertebrate (as he did in _Dragons of Eden_, as someone noted earlier). Sagan also seemed prone to glossing over "inconvenient" facts or alternative viewpoints so as to leave the impression that his view of a matter was the only logical position, and that too "leading people astray," I think.

Sagan had many good qualities, I think, but his ego sometimes overcame his intellectual honesty, and in my mind that is a very bad thing. No matter how many good things he wrote, whenever I read Sagan my B.S. detector is on full alert, as it is with any author whom I've caught bending or glossing the truth on multiple occasions. When I caught him doing that in areas in which I know something, it made me very leery of trusting what he said in areas about which I know less. That, to me, is a big black mark against any author or self-proclaimed expert.

In a more cynical moment I once mentioned to a friend of mine (a real Sagan fanatic) that Carl Sagan's greatest gift was sounding knowledgeable to the unknowing. That's a big component of what made him such a media celebrity; to audiences like the _Tonight_ show and _Good Morning America_ he always presented himself as The Voice of Scientific Authority when it was often his philosophical prejudices and preferences talking.

Of course everyone has preferences and prejudices. But much too often Sagan cloaked *his* bents and prejudices behind the mantle of science, and thus left many (including many of his most devoted followers, it seems) with the impression that they'd heard the voice of science when in fact they'd only heard Carl Sagan. In my mind that does amount to leading people astray, and it's not something that should be glossed over in eulogizing him.

Wil Milan

> your own family members say!

Run in the family? I said there were two, Tom. One is addicted to
heroin. One is addicted to ethanol. Neither one of them have have been
trustworthy, so the other members of the family know that anything these
two individuals say is unreliable. The family member who uses heroin is
still using despite the fact that he is currently on federal probabation.
The ethanol addict is still drinking ethanol. IMO, neither situation is
likely to change direction. Some people just seem to fall through the
cracks, Tom. If there are no such individuals in your family, count
yourself lucky.

IMO, the family members who rip up my family are its two drug addicts.

> Rich, there is no point in continuing this. You apparently have no more
> technical points, and a slander campaign generates little support for
> anyone participating.
>
> Tom

Slander is defined as:
1. Law. Oral communication of false statements injurious to a person's
reputation.
2. A false and malicious statement or report about someone.

Is my quote of your statement in QST magazine false?

Can you specify a false statement I made about QST, ETO, Commander,
Kenwood, Heathkit, Ameritron, or Ten Tec?

Making a truthful statement that happens to be injurious to a person's
reputation is not slanderous. It is part of the impeachment process.

No point in continuing this? Is it just a coincidence that you are
bailing out shortly after you received Wes Stewart's measurements of a
conventional (W8JI) vhf parasitic suppressor vs. a low vhf-Q (AG6K)

parasitic suppressor? // If anyone would like to receive an RTF file/document of Mr. Stewart's measurements, e-mail me and I will send you one. //

RE: technical points: ---I recently received 2 kaput 8874s and 3 kaput 8877s from Lon, K5JV. According to the Funderburg (W6IHA) test for gold-sputtering, 2 of the 8874s and 2 of the 8877s appear to have loose gold particles inside the envelopes. Discussing a look at the innards just might prove to be interesting, Tom, but now it looks like you are going to miss out. .

>
>Any help or related information would be much appreciated. Thanks!
>

Oh dear, this really is a pity as you need the power supply that goes with the 551. This is in a separate box and provides all the required regulated power busses.

You need a 551 power supply. Power supplies for other 2-part Tek's (eg. 507, 517 or 555) will not fit.

If you find the power supply, the connection 1:1 so it is easy to make a cable yourself.

If you decide to build your own power supply, it will need to produce:

about 4 different 6.3 VAC lines at a total of about 10 A (My guess)

-150 V @ 100 mA
+100 V @ 100 mA
+225 V @ 200 mA
+350 V @ 350 mA
+500 V @ 50 mA

The current ratings are approximate but they do indicate that it is probably non-trivial to build your own power supply. Also, they need to be well regulated, typical ripple specs on these busses are of the order of 5 or 10 mV tt.

If you need more info, talk to Stan Griffiths (w7ni@teleport.com) who knows everything about old Tek scopes, Or EJ Holleman (e.j.holleman@student.utwente.nl) who has a 551 and is probably willing to give you a connector pinout if you need one.

Too bad about your scope, for it is truly one of the great classics when complete and working.

On the subject of classic scopes, you are welcome to have a look at the Museum of Tektronix scopes, which can be found at:

http://cal003109.student.utwente.nl/~wel/tek.htm

And should you get the connector pinout, it would be great if you would send me a
copy so I can include it in the museum on the technical info page.

Regards,

Arnoud.

p.s your mailing address does not seem to work.

Ian White, G3SEK (G3SEK@ifwtech.demon.co.uk) wrote:

: Over to W8JI (reproduced here with permission)...

: I've yet to find any tuner (except the ATR-15 as advertised by Ameritron
: in the 80's, and the old EF Johnson KW Matchbox) that always met power
: specifications as advertised.

In a previous life, I was the designer of the Drake MN-2700. I don't
remember exactly what the power spec was, but I remember spending a lot
of time verifying that it met the spec with reasonable margin.

: The MFJ 989 used a roller

It is very difficult to get good Q from a roller inductor. One reason
is that optimum Q requires the coil to be reasonably close to the
optimum length/diameter ratio. The L/D of a roller inductor is close
to zero at minimum inductance. Small-inductance coils should have
fat tubing or wide strap for the conductors, which you don't get with
a roller inductor. Finally, the contact resistance of the sliding or
rolling contact can easily be large enough to affect the Q. For example,
a 1 uH coil with a Q of 1000 on the 40 meter band has a series resistance
of only 44 milliohms. Any extra series resistance will kill the Q.

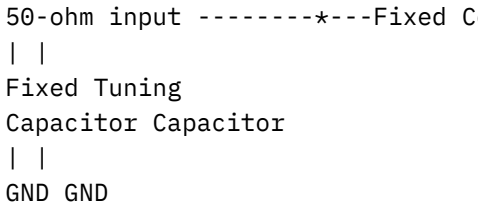
: Roller Q is absolutely NOT a problem of cabinet size
: or anything external to the roller, it is a problem of materials used in
: the roller and the basic roller design.

Coils with very high loaded Q can induce substantial circulating currents
in any nearby metal, so you don't want to get the cabinet TOO small.
What you really don't want to do is get any ferrous material in the coil's
magnetic field. When I was working on the L-75 amplifier, I had used
steel screws to mount the main tank coil. They got way too hot to touch
in just a few seconds of amplifier operation. I replaced them with
brass screws which ran cool as a cucumber.

: As for power ratings, it is NOT correct to specify a power rating
: without specifying both a load impedance and a frequency. ANY
: manufacturer who says "this is a 3 KW tuner" without being band and load
: specific is just howling out a number that may not - and probably will
: not - mean anything to you. The only way to know for sure if a certain
: tuner will work is to try it with your own antennas.

That depends on the circuit design. The above is true for most designs.
However, all the Drake tuners used a PI-L arrangement set up so that the
circulating current in the tank coil is independent of the load impedance.
That means you can specify the insertion loss and power capability without

specifying the load impedance. True, the load impedance does slightly affect the RF voltage across the loading capacitor (the one in series with the output), but it is not hard to figure out the worst-case condition and design the capacitor accordingly.



I remember spending many days with a Smith chart and an HP Vector Impedance Meter verifying that the design met the SWR specifications at all phase angles.

Those were the good old days. These days, I think anything over +20 dBm (1/10 watt) is high power!

232. Re: help with MC1350

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-08 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.970108132331.27597A-100000@Stratus.CAM.ORG>
Source record: 98879

The two outputs of the MC1350 (by the way, the MC1590 is the same circuit, in a metal case and maybe slightly better specs) are 180 degrees out of phase.

More important, the two output pins (1 and 8) are open collector. They need those resistors to +vcc. The only way they would go to ground is if you have your plus supply going to ground, with the minus side floating.

If it works with a resistor to ground, then it's because there is enough gain to overcome the output circuit that can never amplify because it's receiving no voltage.

If it works better with the resistor from pin 1 to ground, then something is wrong elsewhere in the circuit. Maybe you have an oscillation due to bad layout or bad bypassing, and it works better with the resistor to ground because it stops oscillating when the output stage can't amplify. Thus, the "working better" is an illusion.

If the data sheet on the Motorola web page is insufficient, it might be a good idea to get a hard copy of the data sheet (in the form of a data book or specific data sheet for the MC1350) from Motorola. I've always found their information for the device quite good, so I am assuming that the version on the web is incomplete.

The MC1590 data sheet does seem a tad more extensive, so you might get a copy of it.

These devices are at least 25 years old, so there are a lot of old Motorola data books out there that carry this data sheet, so finding a copy used should be very easy.

[Article crossposted from rec.radio.amateur.space]
[Author was Alan Bloom]
[Posted on 8 Jan 1997 20:18:52 GMT]

I'm working on one of the electronics modules for the Phase 3D satellite to be going up this Spring. Does anyone on the net have any experience in designing space-qualified circuitry? I have lots of circuit design experience but have never designed anything for space applications.

What I need is practical advice on how radiation affects the design. I have been assuming that it's only an issue for small-geometry IC's like memory chips. My design is all analog and consists of LM324 op amps, LM339 and LM311 comparators, AD538 analog multiplier/dividers, 78L15 and 79L15 regulators, and some bipolar transistors. Can I assume that special rad-hard devices are not required? (I don't even think they exist.)

The P3D satellite will be in a highly elliptical orbit that passes through the Van Allen belts.

I would be interested in any comments from anyone with experience in this area. It would be helpful if you could list your qualifications in your reply. I'll check this newsgroup for the next couple weeks, but email replies will get to me faster.

Thanks,

Al Bloom N1AL

I cant find any specifications for the 6186W, though it was
listed in my 1970 ARRL handbook for the base diagram only.

Anybody have this info?

Murray's valves are real nice. I plan to use them in some
projects for rf amps. I have seen them used as rf amps for
some of the early am/fm sets in Riders as 6AG5 type.

Anyone else see these used as something other than rf amps?

thanks.

235. Homebrew 12v rotator controller

I received a tv antenna rotator. Unfortunately there is no controller unit for it, nor is there a name on the unit. I did find out that it was originally sold at walmart. It operates on 12volts, which is great as I want to use it at the cottage and we run everything off solar. The question is how to build a 12volt controller. Creating a refersing switch is a piece of cake, but controlling the rotator and knowing exactly where it's facing is the trick. Does anyone have any ideas, or better yet a schematic or some idea where I can get my hands on a compatible (12v) controller?

Hi, some of the big tek scopes came with a trolly and a power supply
on the bottom shelf they had a black cable with retanglar connectors
on each end. circa 1960, No's like 454, 455, I seem to remember
They did need the trolly very large and very heavy,
Hope this helps, why not give tek a ring

mc1350, an oldie but goodie. Where was the other output (pin 8) tied?
It needs to be tied to vcc also. It has a differential output stage.

> According to a 10K pot and the Oscope, a 1K load seemed to be the best
> match to the chip. Does this agree with other people's findings?

It is open collector so it will be a hi-z output. If i remember, it has
a current output so the higher the impedance, the larger the voltage
gain.

> Why does most every schematic with the 1350 in it have the output of the
> chip with a DC path to +vcc. Why is this? The chip seemed to work just
> fine with a 1K to ground.

The differential amplifier in the output obtains it's power that way.
No accident. I can't tell you why it worked with outputs grounded
thru resistors.

> I didn't do any more testing past the 1K resistor. Are the two output
> 180 out of phase? Are there any advantages of tieing the two outputs
> through a xformer? What would the output Z be if they were together?

The outputs are out of phase. Using a transformer would double the
voltage gain. The transformer would also would eliminate any power
supply noise coming in the power pins of the mc1350 from getting added
to the signal since the noise would appear on both outputs and be
cancelled by the transformer. Plus you can match the hi-z output to
a lower z using the same transformer if you need to. You can use
an inductor (or resistor) from one output to vcc if you don't want
to use a transformer -- the other output should be tied to vcc.

> Motorola's web page has been of little help with this chip. I assume
> that it is about outdated and they have very little info covering the
> specs. Any help would be appriciated.

There may be more info on the mc1590. There is a smt part 'tya1350'
(I think) that you may be able to find. I couldn't find it on the
mot web site but I can't find stuff that I know is there either...

I do not recall where I read it, Roy, but is was a long time ago, perhaps in high school chemistry class.

I propose that someone conduct (no pun intended) a test on the conductivity of silver-sulphide to see if this is the case. Unfortunately, my wife's silver spoon collection was recently cleaned, so I may be dead in the water. If anyone possesses a silver object that has turned black from the formation of silver-sulphide, please measure the resistance of the coating with an ohmeter, and report your findings.

I bought TDS210 from Brill Electronics (510 834 5888) for $946.00
Speak to Debbie Valin. Frankly I do not know if there is a differance
between TDS210 and TDS220. As with the previous post mine goes
easily past 200Mhz. There is the usual sampling noise which can
be drastically reduced by averaging. Also the setup recall is a
little inconvenient as it does not allow for measurement window
to automatically come up.These are really silly gripes if one
considers the price. With 1000mhz sampling and 5ns glitch capture
(much better than advertised) it is a great bargain.

Since you are addressing this to me more politely than John did, I will
reply more politely to you...

DID I NOT WARN EVERYONE IN MY INITIAL MESSAGE, THAT I DID NOT WANT
CRITICISM, SIR?

> How can you expect anybody to help you when you treat people the way
> you do?

Help MUST be the information that was ASKED FOR in order to qualify AS help.
Since it was CLEARLY what I had said in advance that I DON'T want, then
it is not help.

If you are visiting someone working on something and they ask you to pass
them a screwdriver and instead you pass them a hammer then you are
annoying them, not helping them, RIGHT?

> If you don't like the help that you are being offered for free then
> hire an engineer and pay him consulting fees. I am sure that he will put up
> with your **** if you pay him enough.

With that language, young man, you just threw all politeness right out the
window. If you can't discuss it without cussing me out, get lost. This is

not email, it's a public forum and kids DO read the posts here.

> By the way, if you are expecting 25-30 bB's of gain you are
> just dreaming.

WHO ASKED YOU? DID I ASK FOR OPINIONS? NO! I WAS SPECIFIC IN WHAT I ASKED FOR AND IN WHAT I DID NOT WANT TO HEAR! ALL I ASKED FOR WERE DESIGN SPECS! IS THAT CLEAR???

> Or do your bB's = MFJ dB's?

Since you DID ask:

MFJ makes crap. They are hung up on using half-wave designs which usually ARE crap. When they figure out what a quad is they might have a clue, but until then much of what they make is overpriced trash.

> 73's

What's the purpose of that? Don't tell me "73" after you just cussed me out. 73 means best regards and you've displayed contempt, not best regards.

TO EVERYONE: KEEP YOUR CRITICISMS AND CONTEMPT TO YOURSELVES! I DON'T WANT IT AND I WON'T HAVE IT! I asked only for antenna design SPECS.

If you can't give someone what they asked for then don't annoy them by wasting their time and "bandspace" with unwanted opinions!

247. Facts vs Opinions

I THOUGHT that these were newsgroups for radio science discussions, based upon factual information. But mostly all I see here are people's unsolicited opinions based upon conjecture.

That's what happens when code skills are emphasized, hailed and rewarded instead of engineering skills. That's also why hams of today would rather buy equipment from a store than built it.

Once upon a time iw was WE who invented everything elecronic! Now most of us have been reduced to clueless consumers, lead by the nose like dumb sheep... a sad legacy indeed to leave to future hams.

When someone asks for calculations, instead they get speculation. But I must warn that if you were to try to build things out of speculation, you'll soon have a pile of failed projects stacked taller than you are.

Amateur radio is a SCIENCE, not a realm of personal opinions! We are SUPPOSED TO BE following in the footsteps of SCIENTISTS, using FACTS!

I shouldn't even HAVE to tell you this! Half the hams I hear these days barely know how to even solder! WHAT the heck is happening to us? Who lowered the technical knowledge standards? Who said that they could? When did it become no longer required to demonstrate the ability to build and troubleshoot radio equipment? It's truely an embarrassment to amateur radio that this has happened! I honestly know of novices who understand electronics better than extras and extras who act like CB'ers!

I am looking for any info on 1296Mhz ATV transmitters and receivers
using FM modulation. If you have built it I would like to here about it
and if there are any plans/kits out there that you know about, please email
me.

Thanks a bunch in advance,
Mike

` Hi Waheeb...

My name is Carlos Alberto...
I'm amateur radio of Brazil...
I not write english very well, but lets go...
The packet radio is a mode of transmition an reception of
digitals signals..
Amateur radio is a class of people with make conversation from
radio equipment.
We have very others modes.. SSB, CW, RTTY, AMTOR, PACTOR,
GTOR, SSTV, SATELITE....
I hope help you...
See about amateur radio in ALTAVISTA SEARCH in ARRL
Bye Bye...

Carlos Alberto

Hmmm, Tek says the 210 is 60 MHz and the 220 is 100 MHz. I decided that I wanted 100 MHz, even though it increases the cost by about 50%.

But if yours goes up to 200 MHz anyway, I wonder if the only difference is that the 220 spec to 100 MHz is guaranteed and the 210 might or might not? Everything else is identical -- including of course the 1 GHz sampling rate.

>Pardon me for jumping in, but I don't think it can be argued that Sagan
>did sometimes lead people astray in the sense that he sometimes played
>fast and loose with the facts.

No pardon required; this is an open forum.

I don't think your "leading people astray" has quite the same
scope as the other fellow's. But in any case, I do not claim that
Sagan was perfect. I know of two errors in "Dragons of Eden", and
though it's been years since I read it, I also seem to remember some
points I disagreed with. Also, former astronaut Frank Borman relates
a story that paints him as a rude idealogue. No doubt there are other
lapses as well. It would take something much worse to convince me
that Sagan's contribution was mostly a positive one.

>He often put on the airs of having much more expertise than he did,
>particularly in areas outside astronomy, sometimes committing blunders
>such as calling a fish an invertebrate (as he did in _Dragons of Eden_,
>as someone noted earlier). Sagan also seemed prone to glossing over
>inconvenient" facts or alternative viewpoints so as to leave the impression
>that his view of a matter was the only logical position, and that too
>"leading people astray," I think.

Except for the "fish foulup", this is pretty vague. Care to give
me some specifics?

>Sagan had many good qualities, I think, but his ego sometimes overcame
>his intellectual honesty, and in my mind that is a very bad thing. No
>matter how many good things he wrote, whenever I read Sagan my B.S.

>doing that in areas in which I know something, it made me very leery of
>trusting what he said in areas about which I know less. That, to me, is
>a big black mark against any author or self-proclaimed expert.

No argument there. B.S. is bad no matter what the source. But
again, how about some specifics?

>In a more cynical moment I once mentioned to a friend of mine (a real
>Sagan fanatic) that Carl Sagan's greatest gift was sounding
>knowledgeable to the unknowing. That's a big component of what made him
>such a media celebrity; to audiences like the _Tonight_ show and _Good

Always? A very sweeping statement.

>Of course everyone has preferences and prejudices. But much too often
>Sagan cloaked *his* bents and prejudices behind the mantle of science,
>and thus left many (including many of his most devoted followers, it
>seems) with the impression that they'd heard the voice of science when
>in fact they'd only heard Carl Sagan. In my mind that does amount to
>leading people astray, and it's not something that should be glossed
>over in eulogizing him.

I think it's OK in a eulogy to gloss over a whole host of sins.
This is, after all, customary respect for the newly dead and kindness
to their loved ones. The balanced assessments can come later.

When they do (I'm sure someone is working on a biography of Sagan,
though I haven't yet heard of any), I think you will find that he
comes off pretty well.

Typo or something....cable is dBmv +55 dbmv is, I think, going to be
-47dBm + 55 db, so that's +8dBm out.
In a 75 Ohm system.

0dBmv is approx. -47dBm., 75 Ohms.

Thanks, ajr/N1TWY

I think the SETI project would liked to have used DSP in the above
manner instead of building all those individual radios to listen at
once. OH well DSP was not a ho-hum technology when they built
the SETI site. ET go DSP.

>

This sure has all the characteristics of an urban legend. I've seen it
quoted as fact many, many times, but have yet to find an authoritative
source. Gary Coffman was the last person I saw quote it as fact, and he
couldn't come up with a reference either. (I wonder how many other
"well-known facts" floating around out there are in the same category. . .)

Now, armed with an ohmmeter, how do I measure the resistance of the coating
without simultaneously measuring the resistance of the underlying silver?
If there were a way, the next question is how to determine the resistivity
of the material given the measured resistance, without knowing the
thickness of the coating?

And, how do I tell silver sulfide from silver oxide?

>TV Channel 2.

Rich, I have at least two concerns regarding these statements:

First, the absence of TVI reports is a totally inadequate
criteria by which to append a seal of approval to any amplifier
modification. The antenna system itself can easily mask the
symptoms, particularly if a tuner or resonant multiband radiator
is used.

Second, operator testamonies, no matter how prolific, are
notoriously unreliable. If the amplifiers have not been tested
with a spectrum analyzer (or simiarly reputable method), nothing
positive can be objectively claimed regarding harmonics. The
only thing we know for certain is that nichrome will raise the
level of harmonics due to decreased tank Q. This alone is
sufficient to question whether anyone should install these devices.

>According to Wes Stewart's measurements, a low VHF-Q suppressor adds
>0.88 ohms of series R to the anode circuit at 10MHz, adds 4.32 ohms
>at 30MHz, and adds 58 ohms at 150MHz.

Could you clarify what you mean when you say the suppressor "adds"
these values? Do you mean these are the values of the nichrome
suppressor coil at various frequencies, or that the entire
suppressor assembly using that coil exhibits the additional R
(compared to a conventional suppressor assembly) stated above?
Also, do these values refer to resistance or impedance?

>At 30MHz, a low VHF-Q suppressor adds 4.3 ohms of resistance in
>series with 1200 ohms of (anode) reactance. I do not know how
>to go about recalculating tank Q if4.3 ohms is added in series
>with 26% of the tank's tune C, so someone smarter than me is
>hereby invited to show us how do the calculations.

I don't know either, but one thing is evident - harmonics will increase. The admittedly few operators I've talked with have reported extremely broad tuning following installation of the nichrome suppressors. Several actually found the technique appealing due to the "vernier tuning" that resulted.

>I do not know of another way of solving the parasitic oscillation
>problem.

There are several effective methods that do not decrease the Q at HF; in fact they may increase it (compared to conventional suppressors), depending on component values.

>Since voltage gain is basicly mu*R-parallel (Rp), i.e.,
>the load on the anode, decreasing Rp appears to be the goal. In Wes
>Stewarts recent tests, a conventional (W8JI/Ameritron) VHF
>suppressor exhibited a Rp of 166.67 ohms at 100MHz, while a low VHF
>Q suppressor exhibited a Rp of 101.73 ohms at 100MHz. In other
>words, the conventional VHF suppressor would yield about 64% more
>VHF voltage gain. For amplifiers that use a silver plated Ls, like
>the TL-922, Henry Radio amplifiers, the Ten-Tec Titan and a few
>others, the voltage gain difference would be even higher.

I'm a little confused by this paragraph. Most amplifiers use a suppressor resistor between 47 and 100 ohms. Assuming the leads from the anode to the suppressor and from the suppressor to the Tune cap are infinitely short, and that the Tune cap represents zero ohms impedance at the unwanted frequencies, how can Rp exceed the value of the parallel resistor in the suppressor assembly? (Perhaps the parallel resistors in the above examples were inductive?)

In any event, unless the amplifier oscillates, it is not the impedance or resistance at VHF that should concern the owners. Rather, the potential problem is the reduction in Q at desired frequencies when nichrome is installed.

Personally, I think there is a basic misconception here regarding the two paths through the suppressor. The typical LC suppressor uses a well-defined, logical concept for its construction. While nichrome wire may indeed reduce or remove parasitics, so will a carbon resistor placed directly at the anode.

The conventional suppressor design is based on the technique of allowing HF signals to take a high Q path to the tank, while VHF and above are shunted to the parallel resistor by the rising inductance of the coil. The speed of the transition is directly related to the Q of the suppressor coil and the value of the

parallel resistor. The more the Q of the coil is reduced (such as with nichrome wire), the slower the transition becomes and the more the suppressor assembly as a whole begins to resemble the simple, undesired resistor mentioned above.

As a final note, nichrome suppressor coils can be simulated by wiring a high Q suppressor inductor in series with a resistor, then placing the usual suppressor resistor across both components. The result of such a design, as with nichrome wire, is to simply reduce the Q of the amplifier for every signal that exits the anode of the tube.

Can ANYONE here give me a computer-designed plan to make a beam antenna that fits the following "rough-draft" parameters?

A 30 turn, logarythimic-spaced, Right-Hand Circularly-Polarized (RHCP) beam antenna for 144.3 MHz, on a manually-swiveling rear-mount boom,(made of 2" OD Aluminum tubing), with a mono-filar element,(made of bare #6 solid copper wire, commonly used by electricians as ground wire for a building's main box), with insulating "spreaders",(made of either 1/2" PVC, fiberglass rods or wood dowels).

My idea is to mount the boom vertically on a universal joint, which itself is mounted atop a 10' mast,(5' of the mast actually being below ground level in concrete), and to use pullies and counter-weights with the non-conductive guy ropes to actually TILT the antenna at the moon,(using a boom-mounted 3X rifle scope to aim it), so by turning 2 lockable cranks I can track the movement of the moon manually anywhere in it's path anywhere within 60 degrees from plumb,(by "plumb" I mean an exactly vertical position). The mechanics of it are much the same as those of the older mobile cranes they used to use on rural construction sites.

BTW: I am not open to the idea of using a yagi, so please don't suggest it.

Please reply via both, the newsgroup and email.

Thank you.

From my experiences with Gary Coffman, he does not proffer bovine feces or porcine shampoo (a.k.a. bs and hogwash). // What is an 'urban legend'?

> Now, armed with an ohmmeter, how do I measure the resistance of the coating
> without simultaneously measuring the resistance of the underlying silver?

Don't use test leads with sharp tips. IMO, it might be a good idea to clean the contact points of the test leads with fine steel wool to remove any oxide before you attempt the measurement.

> If there were a way, the next question is how to determine the resistivity
> of the material given the measured resistance, without knowing the
> thickness of the coating?

It seems to me that the basic question is: does silver-sulphide conduct electricity?

> And, how do I tell silver sulfide from silver oxide?
>
Silver oxide is not obvious. Silver-sulfide is black, and it is far more common, especially in environments that use (hydrogen-sulphide odorized) natural gas heating appliances.

Source record: 98806

Timothy - I would be inclined to start with a receiver for a relatively low frequency (say 10-30 MHz) and then build a receiving converter for 2 metres, using the receiver as a tunable IF. As you will only be covering 1445.8-146 MHz (the satellite segment) you should be able to get a good tuning rate, dial resolution, etc. A rx I made for 20 metres used a NE602 mixer, a ladder crystal filter (from 9MHz CB xtals) a MC1350 IF amp, NE602 detector and LM386 audio amp. You would also need a MPF102 for the VFO and a few extra transistors for the s-meter and AGC.
I think I used a BF981 for the RF preamp.

For the 2m converter, you could use a NE602 or a SBL-1 (if you want better front-end performance) and of course an RF preamp (BF981 again) and xtal oscillator/multiplier chain.

HI jeff.

I'm shooting in the dark here but surely there is resistance of some form
in the rotator. As it turns the resistance goes up or down. Simply supply
voltage and monitor the rotator with a ua or ma meter.

I have a popular rotator schematic if you need to see one.
I could trace it and make it available on my BBS for you to download.

Keep in touch..

I decided to go with the TDS210 because the product differentiation
between TDS210 and TDS220 did not make sense to me.
Here are two scopes with identical front panels, identical specs
except for the bandwidth. The all important digitizer rate is the
same. The only difference must be then the analog front end.
But how much cost difference could there be between 60Mhz
and 100Mhz front end in terms of components? Practically none.
There would not be much sense in setting up two production
lines in this case. I assumed therefore that the differentiation
is made in final test. I further assumed that most sales will be
for rhe TDS210 because of the much lower price so there might
not be enough lower performance units to fill the 210 orders so

the chances were good that I would receive 220 marked as 210.

I can't be too specific, for lack of accurate data. Most semiconductors
appear to survive a few hundred Gray. Device failure seems depend on
how a device is used, rather than on its technology or size.

For bipolar transistors, the effect is a gradual decrease of beta.
In MOS devices, the threshold voltage changes. If your circuits are
designed so as to tolerate large variations of these parameters, you
should be OK.

ECL and I2L logic are particularly resistant (>1e4 Gy). TTL and LSTTL
fare nearly as good. The fast and advanced TTL families are much more
vulnerable and start to show failures from 10 Gy upwards. NMOS logic
seems to be the weakest, with failures showing up somewhat below 10 Gy.
(Ref: F. Wulf, 1992)

In my personal experience, opto-couplers are to be avoided, although
some makes are a little more durable than others.

Best regards,
Jeroen Belleman

265. Mobile sets in rental cars

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-09 00:00:00 UTC
From: "Frank W. van Wensveen" <fvwensve@hvsag01.nl.lucent.com>
Message-ID: <32D50C90.75F0@hvsag01.nl.lucent.com>
Source record: 98810

*** Please CC to my Email address as well. Thanks! ***

Does anyone have a good idea on how to mount a mobile set in a company car or a rental car?

I used to drive my own car; an old clunker so drilling a hole in the dashboard was no problem at all. Now I drive a company car and (frequently) rental cars, and drilling holes for mounting brackets and such is no longer an option. I don't want to put the set in the clove compartment, because during sharp curves or emergency stops it tends to fall out. I've already lost a mobile telephone that way.

The set needs to be fixed firmly so that it won't move while driving around. It also needs to be easily accessible or at least clearly visible. I don't want to have to stick my head under the dashboard while driving.
That rules out the lower glove compartment, double sided tape or other adhesives, and anything that damages the car. (I can't simply drill a hole somewhere. If I do that, I'll be billed for repairs as soon as I have to turn in the car.)

Suggestions anyone?

Charles Mccurdy wrote:
>
> Hi can any one give me any info on how to make a 100 watt dummy load?
The easiest way I know is to get one of those new (well, relatively new) 50 ohms chip resistors. I've got a 150W resistor that cost me about DFl 80,-- (about 50 US $) when they were just introduced. The resistor itself looks like a 5x10 mm ceramic block with a small (2x2 mm) connector strip and a mounting plate. I've mounted that on an X-shaped heatsink that can get rid of 150W. A small piece of semi-rigid is soldered between the resistor and the connector.

The SWR is better than 1:1.05 from 0 to 430 MHz and better than 1:1.1 from 430 MHz to 1GHz.

Hi,

Try giving Pembleton Electronics in Fort Wayne area code 219
a call. He had/has tons of old Textronics stuff around. He's
right across the street from the old Magnavox factory and
surpluses a lot of their stuff, and others as well. Not too
big in computers, but about 30,000 sq ft. Closest thing to the
Chicago - Michigan Ave joints of old. Any grins out there?

> "Coherers"---what were they exactly and how did they work?

AFAIK, a coherer was a glass tube with two electrodes and filled with a granulate conductor or semi-conductor. (Iron filings?) An HF signal would make the granulate stick together somehow, which resulted in a significant lowering of resistance between the two electrodes. (Sorry if this is a little vague but so is my recollection of these old things.)

> I get the impression that they functioned as detectors,
In the sense that they could detect an HF signal, but AFAIK they didn't rectify it.

> but I'm puzzled about
> references to "tappers" and other key-wound mechanisms designed to > agitate them.
The HF signal triggered an (increase of) electric current in the circuit that the coherer was part of. Because the granulate remained stuck together a mechanical means of separating them was needed. Therefore, the current (typically a received morse code signal) triggered a solenoid that activated a little hammer, that tapped the glass tube to shake loose the granulate.

Those were the days...

Even better, start with a receiver. If you've never built an HF project before, it's much better to experiment with a receiver to 'get the feel' of HF.

I just happened to have an old 1967 catalog at my desk and was amused to see a picture of your old 551 sitting next to its enormous power supply. The supply was two thirds the size of the scope and weighed in at 43.5 lbs. I know nothing about these old scopes other than the fact that they were the best there was at the time.

>Or if not how about a 8 ohm non-inductive resistor 5% 20 watts

The non-inductive 8 ohms are just specially wound wire wound resistors
and won't be any good at VHF. The 1 W carbon film resistors are your
best bet if you are constrained to what you can buy at Radio Shack.

A load consisting of twenty 1000 ohm resistors in parallel will be
usable, if you make it very compact. But, it will not be perfect. I
once built a load with thirty 1500 ohm 2 watt resistors. It was
somewhat reactive at 50 MHz, but still adequate for low power
transmitter testing. I didn't check it at higher frequencies.

73 de K9GXC, Jim

Surplus Sales of Nebraska (in Omaha, I don't have the phone number
handy) has 50 ohm Carborundum resitors which would be better, but
slightly more expensive.

273. homebrew security system using toy walkie-talkies

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-09 00:00:00 UTC
From: parnass@marconi.ih.lucent.com
Message-ID: <5b34v3$8op@ssbunews.ih.lucent.com>
Source record: 98818
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.homebrew

I am posting this for Bret Johnson, who does not have netnews access.

Bret constructed an interesting "border patrol" security system
by modifying children's walkie talkies for use with sensors.

He is seeking circuitry information on the Radio Shack #60-4024
Space Patrol walkie talkies.

If you respond here, Bret won't see your posting, so be sure
to mail him a copy of your response at:

johnsonb@laugate1.lau.aetc.af.mil

Bret describes his system below:

| From: <johnsonb@laugate1.lau.aetc.af.mil> (Bret Johnson)
| Status: R
|
| .... Since my only access to a computer is at work,
| I do not have the ability to interact
| with Newsgroups directly (parts to the program that allow that are
| intentionally deleted from our computers). I personally live
| in a bad area -- on the Mexican border -- which is frequented
| by thieves and transients and use a baby room monitor
| transmiter (housed in an outside electrical
| fuse box) to listen for unusual noises (breaking glass,
| human foot steps at 3:00 a.m., etc.) while I am at home.
| Works well with the exception of
| electrolytic capacitors breaking down (maybe the heat?) prematurely.
|
| I would really appreciate some help on another project of mine,
| even if you could act as an "intermediate" to post it
| to a usenet and forward replies to me (I know -- that
| could be asking a lot!). I have various sensors
| available to place on the "Mexican trails" leading towards
| my home but need a wireless reporting proceedure to alert
| me in advance of the possibility of an "undesireable" visit.
|
| Radio Shack #60-4024 Space Patrol (children's)
| Walkie Talkies fit the bill nicely due to size, power requirements, and
| above all -- cost per unit. Replacing the "rubber-duckie"
| antenna with an appropriate length long wire (and jumpering
| the internal loading coil) solves the range problem.
| Cutting the negative battery cable provides a
| nice place to tie relay contacts from my sensors to (the Push-To-Talk

| button can be locked down in a constant transmit mode on this model)
| and serves to enable a signal to be transmitted only when a
| sensor is tripped.
|
| A slide switch is installed to provide a constant "Morse Code
| tone" upon power connection. (This model is equipped with an internal
| audio oscillator and a Code Key button.) The wires to the
| speaker of the "reporting" radios are cut to prevent
| sidetone and provide a "silent" (from the intruder's
| point-of-view, anyway) alarm. Noisy alarms tend to just get stolen,
| especially if the area is lit well enough for a hasty search.
|
| The problem I have is distinguishing which sensor has
| been tripped by the audio tone (sent by its accompanying
| transmitter). Altering the audio oscillator tone for each
| transmitter and just remembering which tone is
| transmitted from where seems to be the best approach.
|
| Can someone help me locate which parts need to be swapped out
| to alter the tone of the internal code-key audio oscillator?
| I've tried Radio Shack and Tandy National Parts
| but no service manual or schematics seem to exist.
| Thank you in advance.
|
| -Bret
| (Radio Technician in the Armed Services)

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have been using an MFJ-259 for the past couple of years and love it. One area where it falls short is output power. I found this when I tried to set up a Mosley CL-33 beam (capacitive coupling feed). The analyzer had me going in circles till I finally just put some RF to the antenna and found that it was fine. The MFJ-259 simply did not have enough output to couple properly to the CL-33. Last night I built some antenna traps and used the MFJ-259 to resonate them. I later placed the traps in PVC to protect them from the weather. I tryed to dip them with the 259 to verify that the resonant frequency had not changed, but the analyzer didn't have enough poop to adequately couple to the trap inside the PVC. I dug out an old Knight brand Grid Dip Meter and it worked (with the usual GDO characteristics). I'm sure that I'm not the only one who has experienced this problem with the MFJ-259. Has anyone out there modified their 259 to increase the output? Lets face it, it needs MORE POWER,.....ARR, ARR, ARR! Thanks for taking the time to read this.

I'm sure you heard of an invention called a "modem"! And most modern 28800 and even 14400 modems have more than one FSK standard built-in these days. In fact, my 15 year old Lynx 2400 SmartModem had them built in!

In the Collins Radio 30S-1 amplifier, R230, a 35 ohm rheostat is used to continuously adjust the filament voltage. I have never heard of R230 failing in a 30S-1. As I recall, the Collins KWS-1 and 208-U10 have continuously adjustable filament voltage.

I asked Terry, W6TG, whether or not the FM and AM broadcast amplifiers he services. have a means of continuously adjusting filament voltage. He said that all of them do. The typical range of adjustment is around plus and minus 5%.

Happy New Year, all.

I'd like to be able to record (unattended) my favorite radio programs and features for later listening. Something like a VCR with multi-event programming would do the job nicely. Some have suggested using a VCR and a tuner connected to the audio input, but that would require going back and retuning the receiver to different stations between events, which is not possible in this case.

Any ideas? Thank you in advance.
Michael

A 1K output load is fine for this device. 1K to 2K will work.

It should work well with a transformer (double ended) output, or with
a single inductor, instead of the resistor. The Xl of the inductor
should be 1K to 2K at your frequency. Likewise, this is the
transformed impedance of thge primary of the transformer design.

The xformer design will give better performance. 3db more power.
improved odd harmonics.

The input may be cap coupled as you did, but did you decouple the
unused input? The input likes to be matched, and for a SSB IF, it is a
good idea to provide a little extra bandwidht-limiting by matching
with a tuned ckt of Q = 5 to 20 or....

What are you going to do with the AGC port?

Also, if you are breadboarding at this stage, may I reccomend a piece
of brass shim stock across the IC to isolate the input/ouptut. The
1350 will oscillate from feedback....

...Bryan
a

Yea, it's old like 20years, but it is still made and it's cheap,
compared to some other IF/AGC IC's.
The databook is good, and the 1349 is similar to the 1350

I've heard from several Mac users who are, to put it mildly, highly incensed that the QST View product is Windows-only. And, of course, there are the comments that havwe appeared on this newsgroup.

The fact is, if we had decided to do this product only if we could make it multi-platform, the product wouldn't exist at all. The only way we were able to do this economically was by means of a good deal with a third-party shop that does the scanning and the software; "normal" commercial providers of these kinds of services are vastly more expensive. The people we are working with supply only Windows software, so that's what's available.

The basic problem, which recurs for just about any software product we produce, is that the number of Mac users who might buy an ARRL product is miniscule. That's not an assumption; we know it from market research. To offer a custom software product that supports both Windows and Mac platforms would require Mac development costs that we could never recover from sales to Mac users. In effect, the pricing would have to be such that the Windows users would be subsidizing the Mac users, and I hardly think that's fair. Now, if we were selling hundreds of thousands of each product, things would be different. But we're not, and comparing ARRL's electronic products to those that sell in large quantities is a poor comparison.

Of course, if we could find low-cost, off-the-shelf multi-platform products that would provide the capabilities we need, we'd use them.

We've not found any such as yet. (We're always interested in hearing about any you know of.)

As I've said to several Mac users, if I had *my* way we'd include Linux X Window applications on the CD-ROMs. But that's not going to happen any time soon for the same reason.

Ummm... how does one implement a searchable database in HTML? You need an HTTP server with CGI and a database application. And of course, that software would have to be multi-platform.

> HTML retrieval and display systems are here, more importantly they will
> be around for quite some time ... and are platform independent.
>
> As it is, I'm waiting on the OS/2 version of the QST CDROMS for my
> personal system and the Macintosh version for my wife's system.

I'm afraid you'll have a long wait. I'll point out one thing, though. The image files on the QST View CD-ROMs are standard TIFF files (using CCITT Group 3 compression). And the database for each set is contained in a comma-delimited ASCII file on the first disk of the set. (The file contains a few SQL engine commands you can ignore.) If some enterprising Mac (or OS/2, or *nix, or...) software type wants to write an application for his/her favorite platform that will search and display the files, I'd be delighted. Heck, I'll gladly make it available from ARRL's Web site. We just can't afford to *pay* anyone to do it.

Check the plate resistors on the 12AU7 sideband select BFO. They should
both be 33,000 ohms. Often one or both will be much higher than that.
They ran pretty close to their full 1/2 watt dissipation rating and many
brands aged badly, climbing very high in resistance over the years.
The circuit works pretty well up to 100K, but if they go much higher,
the amplitude of the oscillator output is too small for the ring
modulator and detector to work correctly. Then, you have a terrible
time with Rx tuning, and low transmitter drive/power output.

This is a good point. Any choke you use should be chosen the same way
you'd choose a plate choke for an amp, IE there shouldn't be any self-
resonances at frequencies of interest. I've successfully used a 2.5 mH
choke on a 160m long wire, but that probably isn't a good idea on the
higher bands. A resistor suffices, and avoids most of this sort of problem.

Well, I haven't measured the input impedance of many HF receivers, but I
get the impression that they don't much care about a match. What I meant
by voltage driven is in the same sense that a VOM is voltage driven.
Of course it takes power to swing the pointer, but we usually don't think
of it that way. With modern devices, HF receivers aren't internal noise
limited, they are atmospheric noise limited, so they don't need a match

to achieve best MDS.

>If the capacitor passes HF RF, then I suspect it is almost useless for
>lightning. It would only be effective at VLF frequencies and lower as an

>that is very fast, so the cap looks like it is not even there.

No. It is precisely because the risetime is so fast that the capacitor
works. It has to have a time constant such that its dV/dt charging slope
is 350volts/2nS or more. That allows the gas tube time to fire before the
surge gets clamped by the receiver input shunt impedance, IE a cavity or
helical filter with an input loop. To an RMS HF signal, it looks like
a low series impedance, but to the very fast pulse, the charging time
is sufficient to provide the needed slope. (To protect equipment operating
above 500 MHz we have to do something different. In that case, we use a
line section to give us the phase delay we want to allow the gas tube to
see the transient at least 2nS before the equipment does.)

>>On receive, the *receiver* is the load presented to the line, not the

>than any of these gas tube gimmicks for protecting a receiver. A pair of
>clamp diodes and a fuse link, plus a hardened front end would be better
>than transmit type surge suppressors.

Not true. A properly designed and installed gas tube suppressor will
protect a receiver. I've taken the direct strikes to prove it, clients
of mine have taken the direct strikes to prove it, and I've proved it
on the lightning simulator too. The reason that it works is that the
suppressor will carry kilowatts of RMS RF, but it clamps in under 2nS
on a transient which exceeds its firing voltage. When it clamps, it
becomes a *very* low shunt impedance (milliohms), and won't let enough
energy past to damage the receiver components. A 350 volt 2nS pulse won't
damage a HF receiver. The junctions can avalanche that long without
permanent damage. After that initial 2nS, voltage is clamped to a
very low value for the duration of the strike pulse, so very little
current can flow past the gas shunt on into the equipment. But we
need that capacitor in there to let the gas tube see the firing
potential before the equipment can shunt it.

You can buy gas tube units with firing potentials as low as 18 volts.
In a receive-only situation, that's an even better choice than using
a transmit rated suppressor. But the transmit rated suppressor *will*
do the job if selected and installed properly. In transceive installations,

there is no choice, you have to use the transmit rated suppressor. Even with a separate receiver and transmitter, TRed to the same antenna, the transmit rated suppressor is almost always the better choice. You want the suppressor as close to the entrance to the facility as possible, IE *in* the ground window for the station, and that almost always means it has to go between the TR switch and the antenna, so it has to handle transmission as well as reception. An exception would be when you have a mast mounted preamp and TR right at the antenna. Then you can protect the RO line separately from the Tx line. (Mast mount preamps usually should be considered sacrificial, protecting them is a difficult job at best, though it *can* be done.)

Another thing of note is that your transmitter *must* provide a means to automatically trip off if it is presented with a virtual short on its output. That's because the gas tube will continue to conduct as long as there is current available after it fires. So if you take a strike while transmitting, you have to shut the transmitter down for at least a few milliseconds to allow the gas tube to quench after the strike pulse is over. And power should be limited for a few seconds after the strike to allow the gas tube to return to its rated firing potential (a hot tube has a lower firing potential than a cold one because it is still partially ionized, so it may fire again at normal operating voltages unless it is allowed time to recover).

One clever way to implement this is to *watch* the gas tube with an optical sensor separated from the tube by a good length of fiber optic cable (if the sensor is too near, transients will be induced in it, corrupting its signal). When the glow of firing is detected, trip off the transmitter for a timed delay and then ramp power back up slowly over a period of a few seconds. Of course a manual reset is almost always slow enough to allow the tube to recover.

Me, too!

I bought a Reveal FM radio board for the PC (about $40 at Best Buy), with the idea of being able to program it as you suggest.

<flame> I got disgusted at the dain-bramaged software that came with it (only 10 presets, hard to set with fixed scroll rate, roundoff errors in freq display, . . .). I'd have kept it if I could have gotten specs for how to control it -- I'd have written a control program myself. But their "24/7" tech support line put me on permahold so I gave up and returned it. </flame> I could always buy another one if I decide to try it again someday. It seemed like a well-build piece of hardware.

Seems like you could build an integrated control out of an old XT with the FM radio card in it and an IR emitter to drive the VCR. If the VCR won't record sound without a video signal to sync to, put a CGA card in the PC; you could put a timestamp on the video to tell you when the audio was sent, freq, station/program ID, etc., in nice bold characters that would show up in fast forward / rewind.

If your existing FM receiver is IR controllable, then that opens other possibilities.

I agree, this is a product that is missing from the marketplace. Probably wouldn't be terribly hard for the VCR makers to implement, either; they already have the front end, what's a couple more chips for the FM broadcast IF and detector? They can sell an entire Walkman for $cheap. . . It'd be neat: an 8-hour stereo audio recorder! There's not much on the tube worth watching, anyway.

We can't be the only two who've felt this need. Ideas, anyone?

Teddybear, the modem used by TDDs differs from the standards that we use
for 300, 1200, and up. It remains that way because of grandfathering
issues; there is a large installed base of user-owned equipment.

Care to write the DSP code to do it on a standard modem platform??

Hi Teddy,

Some thoughts on this interspersed with your text.

Teddy Bear wrote:
>
> Can ANYONE here give me a computer-designed plan to make a beam antenna that
> fits the following "rough-draft" parameters?
>
> A 30 turn, logarythimic-spaced, Right-Hand Circularly-Polarized (RHCP) beam
> antenna for 144.3 MHz,

I'm not sure what you mean by log-spaced for a helical antenna (helix).
The helix is a spiral and is defined by circumference and pitch in
degrees. Log spaced relly makes no sense here. It does for yagis and
log-periodics and others, but not for helicals.

Also thirty turns for the 2m band is going to give you one ENORMOUS
antenna. Probably something on the order of 50 to 60 feet. Nice gain it
would have though, around 20.5 dB.

> on a manually-swiveling rear-mount boom,(made of
> 2" OD Aluminum tubing),

Rear mounting of a 60 foot boom? not likely. And the boom for a helix
has to be non-conducting and preferably low-loss fi it is a dielectric.
The interior of a helix supports a traveling wave and therefore needs to
be free of obstructions to that wave.

> with a mono-filar element,(made of bare #6 solid
> copper wire, commonly used by electricians as ground wire for a building's

Hummm, more like bend the boom of the antenna. Even with the u-joint
youve set up quite a cantelver and that is going to bend BIG-TIME. I'm
not sure what a bent boom helix is going to do. This proposal seems to
be getting further and further from realistic.

> a boom-mounted 3X rifle scope to aim it), so by turning 2 lockable cranks
> I can track the movement of the moon manually anywhere in it's path

Ummm, yeah.

> The mechanics of it are much the same as those of the
> older mobile cranes they used to use on rural construction sites.
>
> BTW: I am not open to the idea of using a yagi, so please don't suggest it.
>
> Please reply via both, the newsgroup and email.
>
> Thank you.

Well I can see some advantages to a helix over yagis, and I'm considering one myself for 2m, but I don't see why you don't want them for EME that's your call.

But you can get the same amount of gain as a single long helix by stracking several shorter ones in a box pattern. Four 8 - 10 turn helicals spaced approx 1 wavelength apart would be similar to one single 30 turn as far as gain. The booms would then be more managable at 15 - 18 feet. The groundplane screen however would be something like 15 feet square.

Maybe if we started with what your goals are, then we could find something more realistic to do. But if you insist on doing it with your rough specs tehn I can supply the relative cookbook plans. The helix is not all that complicated to need to go to a computer design.

Jim

>left inside the house.

Lightning energy travels on the outside and *inside* of the coax.
The part flowing on the outside can be dealt with by direct bonding
to the ground window, but the part flowing on the inside requires
a suppressor at the ground window.

If you don't want to do it right, however, getting the coax out of
the house is a good suggestion. Individual step leaders can traverse
150 feet of air in bringing the lightning energy down from the cloud,
so a few inches separation in the shack isn't going to do much good.
If you don't snub the energy properly at the shack entrance, you've
just invited Reddy Megavolt into your home, and he can be quite the
vandal.

Depending on unhooking the coax and tossing it into the yard often
isn't practical, however. The most intense strike I've taken here
happened on a grey November day with a light drizzle falling. There
was no prior indication of thunderstorm activity, no thunder heard,
and no warnings on the Wx radio, just a light drizzle, then <click>
KABOOOOOM!!!

(if you hear the "click" just prior to the earthshattering boom and
blinding flash, you're too damn close. The "click" is caused by direct
induction into the auditory nerves from the strike current, and means
you are very deep into the most intense part of the field.)

I don't think most people would unhook their equipment every time a
light drizzle was falling. But as my experience shows, you'd have to
if you depended on this method for protection.

measures@mail.vcnet.com (R. L. Measures) wrote:

>. . .
> // What is an 'urban legend'?
>. . .

[This is getting off the topic of amplifiers, so I changed the thread
name.]

An "urban legend" is a story which is widely told and believed, and is passed along from person to person, but for which the facts can't be verified. When an attempt is made to trace the origin of such a story, each person seems just one or two links away from the source. For example, each person claims (and believes) it happened to a person known to a friend, but when the friend is asked, it seems to have happened to a friend or acquaintance of that person, etc. At least a couple of books have been written on the topic in the last ten years or so -- perhaps someone can point us to a reference. (Or is that an urban legend, too. . .)

I consider the "fact" that silver sulfide, oxide or other salts are good conductors to be an urban legend. All attempts I've made to find the source have resulted in "I heard it from. . ." but never a pointer to an authoritative source.

I'm really missing out here. Suppose I took my black spoon, used some cleaned, dull-tipped probes, put them on the spoon and measured 200 ohms. What's the resistivity of the coating? Of course, if the silver sulfide is a good insulator, I would read an infinite resistance. But the basic

question isn't whether it's an insulator or conductor. It's whether it's a very good, good, poor, or lousy conductor, i.e. what its resistivity is.

>> And, how do I tell silver sulfide from silver oxide?
>>

> Care to write the DSP code to do it on a standard modem platform??

Maybe you weren't paying attention. They CAN do TDD! Maybe you don't have the software for it, maybe you didn't read your modem manual thoroughly or maybe you don't know what standards TDD's use? I'm SURE that most of these name-brand fancy-pants modems have them, becasue even my cheapo $87 (tax included) Best Data model 2834F has the following 4 standards in it of the 6 standards currently installed in many TDD's:

Bell 103 FSK
Bell 212A DBSK
V.21 FSK
V.23 FSK

All it needs is software that can access these standards. And none of that's not including the 9 different FAX standards my 2834F does:

EIA/TIA 578 Class I
EIA Class II
Group III
ITU T.3
ITU T.4
ITU V.17
ITU V.21
ITU V.27ter
ITU V.29

It also does V.34, V.FC, V.32, V.32bis and V.22 Data Standards plus the 4 Standards used by TDD which can also be used for Data connections. It has everything except HST,(which nobody uses anymore)! "Gee... all that and without paying USR's rip-off prices!" you might say,(and you'd be right)!

Bottom line: There is not just one single TDD standard you know.

Log spacing of the coil instead of even spacing.

That's an old XYL's tale.

> antenna. Probably something on the order of 50 to 60 feet.

The length for MONO-filar would be about half that,(30 to 40 feet maximum).

> Nice gain it would have though, around 20.5 dB.

I expect 25-30 bB.

> > on a manually-swiveling rear-mount boom,(made of

As I said above... 40 feet max... Plus I did mention the use of guy ropes.

> And the boom for a helix has to be non-conducting

Not so when you're talking about 2 meters. They used to say the same
for quads and I've seen 3 quads that prove that old XYL's tale wrong. One
of them is 12 element at 17.5' long and the other 2 are 9 element and 10'
long and not only do they have a flat match but their beamwidth is as sharp
as a tack and their gain is better than their PVC prototypes.

I don't remember asking for criticism. I remember asking for a computer designed plan. Translate that as this: The only things I was asking for was the exact spacing, overall wire legnth, helix diameter and reflector demensions, nothing more.

> Well I can see some advantages to a helix over yagis, and I'm
> considering one myself for 2m, but I don't see why you don't want them

Hold on here.

I'm obviously not getting all of the comments to this group, but I'm seeing references to my measurements showing up already.

In the interest of clearing up some of the issues raised about parasitic suppressors, I volunteered to perform some laboratory measurements on the materials being used by Mr. Measures and those used by everybody else.

Rich sent me some samples of his nichrome alloys and Tom, W8JI, sent me a sample suppressor from an AL1500 amplifier. I have measured various parameters on these devices using precision laboratory equipment and have forwarded the data to these gentlemen. Rich received his OK, but Tom has not. He has requested that I FAX the material to him, which I will do later today.

I mentioned in private correspondence that I would post the info here, after each of them had a chance to review and comment upon the data. Clearly, Tom has not had this opportunity and I have not been able to present the data in what I hoped would be an impartial manner.

I believe that until Tom reviews the information and I post the complete summary, it is only adding more confusion to the discussion to make references to it.

Hi all,

Well when I read the original post asking for help, the tone of the wording and absolute strangness made me think that it might have been a troll. Something gave me the impression that this ask for help was more than just that. Now it turns out that my sixth sense proved correct and this person really seems to not want help or advice, but is more interested in a flame war, or is simply a jerk. I'm not sure. It is really sad that this person chose to be confrontational when someone else was honestly trying to help.

But I'll give it one more shot, since others may learn something about helicals and I think that is a good thing.

In all the many texts, cookbooks, etc. treating helicals that I have seen in my research of helicals including Kraus I have never seen any mention of log *spacing*. Some have mentioned stepped or tapered changes in diameter of the coil, but none have talked about variable spacing. In fact, if the spacing, which is defined by the pitch is changed much out of the limits of 13 - 17 degrees then the helix will start to change from the axial mode to the normal mode meaning this is no longer the antenna that is desired.

>
> > The helix is a spiral
>

> Duh.

You seem to be a fantastically tempered person, how nice. It is always
so refreshing to be treated so well from someone that is asking for
help when that help is returned.

Throwing out cliches does not make it true nor does it serve any
usefulness.

>
> > Also thirty turns for the 2m band is going to give you one ENORMOUS
> > antenna. Probably something on the order of 50 to 60 feet.
>
> The length for MONO-filar would be about half that,(30 to 40 feet maximum).

This is the second time that you have seemed to make a big point about
monofilar, big deal. This is by far the more common design compared to
bifilar and quadrifilar.

Anyways, for an axial mode helix the parameters of the "coil" follow:
.9 < C (Circumference) < 1.3 wavelengths
13 < p (pitch) < 17 degrees

Typical values are 1 wavelength for C and 14 degrees for p.

Otherwise it degenerates to a normal mode helical or dipole like
antenna.

The value of S which is the lineal length of on turn is found by:

S = C * tan(p)

Taking C = 1 lamda at 144 MHz = 6.83 ft * tan(14) = 1.70 ft = S

Now for 30 turns 30 * 1.7 = 51 ft plus you add some more for the
feedpoint and matching area.

>
> > Nice gain it would have though, around 20.5 dB.
>
> I expect 25-30 bB.

I do not believe this is possible. Nor do any of the other people I
contacted on this issue.

>

> As I said above... 40 feet max... Plus I did mention the use of guy ropes.

The premise of 40 ft is questionable based on the "log spacing" but
even then, 40 ft is a long boom. Your right about the guy ropes, it is
not a pure cantelever, but even with support at both ends, it will
deflect in the middle area.

A quad is not a helix. A quad is not a treveling wave antenna and a
helix is. The helix relies on supporting an E field on the inside of
the coil. The quad does not. This may have some relevance, but if it
does then it is small and circunstancial.

I was not criticising you as you seem to be taking it so personally. I
was questioning the ability to realistically achieve your design goals.
If soemone asked you for plans per spec for something that is in your
area of expertise and it was apparant that they would have a difficult
time making it would you not state it so? Or would you simply answer
the question and let them try to deal with the unrealistic situation.

It's kinda like the new ham that was asking me to help him with an 80
meter antanna. He lives in an apartment. He mention that he had heared
that a quad was a good design, and wanted soem help with that. By your
demeanor I should have simply told hime the design formulas and left it
at that. But he was much more thankful that I explained that a 20m on a

side square plus a long boom would not quite fit in on on his apartment.

> helical much less built one?

Yes I have critiqued your design spec. But no you are wrong with teh rest of your statement. No I do not currently have a 2m helix. My housing situation precludes that. I did use to have one at a differnt location used for satellite weather sat. I have built a few for/with friends for 2m. I have built and experimented with dozens of others for bands other than 2m. I have also studied them for classwork back in school a few years ago, and written dissertaions on them. I am no stranger to teh design and performance of the helix.

I said I could do that. And my advice is not speculation, it is experience from a good deal of experimentation.

> My time is valuable and my money
> is sparse. This is not a game to me so I can't just wing it.

Well my time is also valuable, probably more so since my money is not sparse. With the free advice I have supplied to you costing roughly $350 dollars time equivalent if I were to charge... I'm very glad that you are so gracious with my advice that was sent with good intentions to help out a fellow ham (or radio-nut since I can't find your name in the callsign lists for certain).

But that is the treatment I should have expected from someone connecting to a Monterey Park ISP. From down in the Los Angeles cesspool. I just love that the cretins from LA are there and not where I am.

Soemone mentioned that we might just have ALTAVOZ back, and it sure does seem so. When he was back on with the worldnet.att ISP he would connect to either an LA area pop or a SF bay area pop. Always posting many messages from the same pop per login. I couldn't find out his pattern before his account was yanked. Now this winner is from LA too and pretty much has the same attitude and temperment as ALTAVOZ. Maybe I can hope his account gets yanked also.

For the others that have posted concerning Teddy's attitude, thank you.

Jim

291. Help with Shure 444D and Icom 751A

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-09 00:00:00 UTC
From: picture@fosston.polaristel.net
Message-ID: <picture-0901972053250001@erskine-45.dialup.polaristel.net>
Source record: 98836

I just got an Icom 751A and want to use my Shure 444D on it. I put a 2.2 mfd electrolytic in series with both the high and low impedance lines as a voltage block. It eliminated the "pop" on low impedance, but not on high. The mic works very well on low- I get great reports. What will it take to cure the problem with high impedance? a 4.7 mfd?

PLEASE E-MAIL ME.

THANKS,

GREG

On Fri, 10 Jan 1997, John M Dashner provoked me by saying:

> The conotation of "Teddy Bear" to me suggests a fat ass sitting back who is
> either:

Hey... Go screw yourself, butthole. You are NOBODY... as in Nobody to talk and as in Nobody to me. If you think the purpose of this newsgroup is to dessimate criticism, you must be one of those lame fidonet rejects like Ken Freeland, accustomed to flames and retarded in brains. Since you have such a love affair with criticism, how's that suit you? And I'll bet my assessment of you is accurate too.

This newsgroup is NOT for flaming so go back to Fight-o-Net and leave us alone to discuss HAM RADIO, dumbass! NOTHING I SAID TO JIM DESERVED WHAT YOU SAID TO ME! But you, by blasting me without sufficient cause, deserve every bit of what I am saying here now.

> 1. wanting to have a little perverse fun at other's expense; or
> 2. someone who truly needs help but not the kind you have asked for.

ACTUALLY you are doing exactly what you accuse me of on both, counts 1 & 2!

Only a clueless half-assed moron who speaks without knowing the entire story would see it the way you did. If you thought Jim was right for replying to me with what I TOLD him I did NOT want to hear, then you are indeed a moron for speaking up before you read my FIRST post which was a mere 24 hours ago or less so you can't use the excuse that the post was already deleted, since it wasn't! You deliberately flamed-on without threading back to see that Jim WAS INDEED bringing it upon himself!

He WAS warned, and chose to ignore the warning, so it is HIS OWN FAULT that I replied negatively, you clueless idiot. When I tell someone not to bother me with something IT MEANS DON'T FRIGGING BOTHER ME WITH IT!

I hope your VE will one day regret taking the bribe that got you your license. You obviously don't have the attention span it takes to EARN one!

> I have seen people ask for help and submit their own ideas worked up to the
> point of exhausting their knowledge,

Oh you're breaking my heart!

> but the crap you submitted is what led me to the conclusions stated above.

Your post was absolutely out of line and off base. Everything I said in this reply was provoked by YOU. If you want to hold Jims hand and kiss his butt, go ahead and do so IN HIS EMAIL, NOT MINE!

No further email messages from you are welcome here and WILL be reported to your ISP admin as net abuse. THAT IS A PROMISE! I am sure that they, like most ISP's have a company policy against harrassment eminating from their customers. Learn to PAY ATTENTION TO A WHOLE THREAD before you go shooting your mouth off or keep your stupid mouth shut, twit!

You obviously have an attitude ploblem "teddy bear". Someone here is trying
to help you and at
the same time you are treating him like an idiot. How can you expect
anybody to help you when
you treat people the way you do? If you don't like the help that you are
being offered for free then
hire an engineer and pay him consulting fees. I am sure that he will put up
with your shit if you
pay him enough. By the way, if you are expecting 25-30bB's of gain you are
just dreaming.

Or do your bB's = MFJ dB's?

My recommendation would be Svetlana. They are out on the web, and even have the specs on line for download. I replaced some 4CX250R's with their product and have been very pleased. Excellent service from the 'counter' folks. I believe they have tightened up on the quality control a lot. Current Kenwood TS-520 is running a pair of 6146W's that are also from Svetlana and they seem OK.

Why not try a modem. A lot of the terminal program (I use Procomm Plus) have a chat capability with a buffer and all. It would enable you to send and receive in real time with no operator. I think the cost is around CDN $150.
I know I've used it from home to work when the Missus had to set file for me to download, and I gave written instruction right over the modem/terminal program.

305. www.hamradio-online.com: FCC CREATES 300 MHZ of UNLICENSED spectrum

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-10 00:00:00 UTC
From: vbook@vbook.com
Message-ID: <5b4jhs$nlq@kanga.accessone.com>
Source record: 98706
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew

Today, the FCC issued a Report and Order creating three 100 MHz wide bands in the 5 GHz area for use by unlicensed wireless devices. The bands include changes to the rules in the Amateur shared allocation at 5.725 to 5.825 GHz. Under the new rules, unlicensed devices may operate up to 4 watts EIRP (depending on the band) and may optionally use high gain directional antennas (depending on the band).

Today's ruling make possible high speed wireless Internet access over potentially several miles. You can expect to see unlicensed wireless T-1 (1.544 Mbps links) service drastically undercutting the costs of renting T-1 lines from local phone companies (often $3,000 per month). Many other applications are expected to be deployed under the new rules on the new frequencies.

This is a tremendously important announcement in terms of the future of Internet access and short range wireless communications. It also involves the Amateur service as one of the three bands is shared with Amateur Radio.

We have the FCC press release and full text of the Report and Order at http://www.hamradio-online.com

Don, are you referring to the plate choke bypass cap? If so,
the problem might be the choke itself. Is it the original choke,
and are you operating the amplifier on any frequencies it wasn't
originally designed to output? I'm thinking about the possibility
of a series resonance in the choke that might show up if a non-WARC
amplifier was used on the WARC bands. Most (all?) plate chokes
have resonances that fall below 30 MHz, and they're designed so
those frequencies fall between the ham bands.

Sorry if this was suggested earlier in the thread (I missed the
earlier posts).

Yikes!! Please don't do this to good probes - some are plated
with an alloy that resists oxidation. Once the material underneath
shows through, they're useless unless you want to steel wool 'em
every day.

OTOH, Feel free to do this on the cheap chrome probes made
in Taiwan and China. ;)

From what I've read, most PVC won't have a significant effect on the HF bands, in terms of loss. One way to test it is to cut a few inches of the PVC you intend to use, and place it in a microwave oven next to a glass of water. If the PVC heats, its losses *might* be unacceptable at HF.

One other thing to consider is the capacitance of the PVC, assuming the dipole wire is in physical contact with it. This might be troublesome regarding tuning of the dipole, particularly if the wire is simply laid inside the pipe and is free to move around. I've never tried this though, so I don't know for certain whether it would be a problem.

Fred,

You're the first person I've heard from with direct experience in measuring
silver oxide. It's interesting that its conductivity is as good as silver,
which I had thought to be the best conductor known (at room temperature).
Did you also measure silver sulfide, perchance, since as Rich points out
it's much more common as a contaminant.

I personally do see a reason to research the point further, and so far I
have yet to see any foundation at all for claims about silver sulfide
(although I now have your experience as testimony that silver oxide is at
least as conductive as silver). The possibility that one can oxidize silver
to further increase its conductivity should excite some interest.
Even if it's only as good as silver, this information may be
important. Silver has some real problems as a conductor material on
substrates due to metal migration. If silver oxide doesn't, and is at least
as good a conductor, it may have some real advantages for this use. It's a
shame the results of your experiments weren't published.

I absolutely have no reason "that can be articulated to support a contrary
belief." However, I don't see this as a reason to inhibit asking for

support of a statement given as fact. This is a matter of personal philosophy.

Oh -- Where were these experiments done?

Thanks for the information!

We were, for many years, the only broadcast manufacturer to employ a
staff chemist. This exact question came up during his tenure. The
search for an "authorative source" was also fruitless at that time.
There were, however, measurements made here to confirm the legend.
The results were never published but they amounted to two
generalizations:
a) silver oxide is at least as good a conductor as silver, and
b) other contaminants could impair this conductivity.

Now, if it becomes a matter of national security or you have a reason
that can be articulated to support a contrary belief, I suppose a
wider net could be cast to get absolute numbers. As a practical
matter, however, I see no reason to either research the point further
or to dismiss the common belief as without foundation.

Another handy hole making tool is the Unibit. There are a couple of different sizes, up to about 1" max. Each one drills its own 1/8" pilot hole. The bit is stepped in 1/16" increments, so the final diameter depends on which step you go to. The steps are wide enough for 1/8" panels. The Unibits are moderately expensive ($25-$30, I think), but they make nice round holes which are much nicer than the triangular holes you get from two-fluted drill bits in "hand-held" work. I haven't tried them in anything but aluminum. I sure wouldn't use them on steel--don't know how they do on brass.

Maybe I expected too much of people's ability to give me only what I asked for or to leave the answering to those who CAN.

If my high standards for engaging in scientific discussions seem to be too much for some people who access these newsgroups to handle, I can only apologize for not realizing that. However, I will not apologize for having such high standards for engaging in scientific discussions. The latter is not a sin.

Perhaps I just tend to sometimes forget that ham radio is just a hobby to some people and that said people think that the phrase "just a hobby" is synonymous with the phrase "just a game".

Ham radio cost a lot of money as you all know. I am not a rich man. Therefore I take it much more seriously than most, because I take my money much more seriously than John Q. Deep-Pockets might.

To me ham radio is NOT a game. It is an educational laboratory in which we are supposed to hone our skills as elecronic engineers or something like that. I find that not many people look at it that way. To many, ham radio is just a more respectable version of a citizens band, and these kind of people are everywhere from novice class to extra class in similar percentages from class to class. I find that frustrating sometimes, DEPENDING of the forum. "When in Rome..." you know. Well in THIS forum, the names of these three newsgroups lead me to believe I would be talking to people who are as technically serious as I am. Now I see I may have read too much into the whole thing and thus formed unreal expectations of some of you.

Let me try to make it easier to avoid conflicts in the future:

If you take ham radio and electronics VERY seriously, as I do, then I welcome you to share your studies and knowledge with me, and if you ask, I'll try to do likewise.

But if you are a "weekend warrior" who enjoys a good ragchew discussion, but ham radio is just a high tech game to you, sorry, but I do not come to technical newsgroups for that so ignore my posts because I am not going to be like a friendly puppy and go play frisbee with you in here. I find that annoying and it provokes me into being cold and if you tell me off for being cold then I am going to be very mean and nasty. Thats just the way that I tick, so don't say I didn't warn you.

However, in NON-technical newsgroups I can easily be just one of the guys and be able to kid around and have fun like anyone else, but "I don't mix my peas in my spuds" as they say. I am technical in technical newsgroups

and I am human in non-technical newsgroups and never the twain shall meet. So don't try to make me be like you, running and hopping and skipping without regard to whether I am in a lab or on a playground.

Business is business, pleasure is pleasure and science is science to me and you might like to mix them but I can't and I won't and you will piss me off if you try to force me to be like that. I am the same on the air. In a technical QSO I don't want to hear about what your favorite movie is or what good gumbo your wife can make and in a SOCIAL QSO I don't want to hear about which resistor you put on the emitter of which transistor.

This is not a social newsgroup, it is a technical newsgroup. If it were a social newsgroup I would be in an entirely different mindset. If you don't like the mindset of "Just the FACTS" then PLEASE... leave me alone and I will return the favor! Is that too much to ask? It seems fair to me!

> AF4Z@TNG.NET

You might try Peter W. Dahl in El Paso. 915 751 2300. However, to the best of my knowledge, he does not make current-limiting type transformers, like the one Heath used---so, you will need to add a step-start circuit to limit the inrush current to the filaments. Adding a rear panel adj. rheostat to set the filament v would be nice. There's plenty of room in the fan blade section for a rheostat. If you are interested, E-mail me or telephone.

BTW, if the (unfused) filament transformer failed because a 3-500z shorted between the filament and the grounded grid, chances are that you had a vhf parasitic oscillation. This problem can be corrected so that you don't experience a repeat performance in the future with the new tube and transformer. // An article about the SB-220 appears in the Nov./Dec. 1990 issues of QST magazine.

Hi Alan,

I can speak only in general terms, specific cases may very.

In article <5b1207$gkt@canyon.sr.hp.com>, alanb@sr.hp.com (Alan Bloom) writes:

>It is very difficult to get good Q from a roller inductor. One reason
>is that optimum Q requires the coil to be reasonably close to the
>optimum length/diameter ratio.

Q change from a large L/D ratio change is generally not extremely large. Optimum L/D ratio is dependent on both the end application and the wire size of the winding. The thing that really "kills" roller inductor and other coil's Q is stray capacitance and dielectrics placed in areas of strong electric fields.

The truth is virtually every roller has much less Q over its' entire than any poor to moderately well designed fixed coil. EVEN WHEN the L/D ratio is some "magic number".

Roller inductors "stink" in applications wher high Q is required, but people still love them. Plus the thing to remember is it isn't the self Q of the inductor that is important in most tuners, it is the lack of enough capacitance range to keep the loaded Q low and efficiency high.

>The L/D of a roller inductor is close
>to zero at minimum inductance.

Inductor Q matters LEAST on higher bands in a tuner. That's because of two factors, load impedances tend to moderate and the capacitance is generally so large that the tuner operates with a low ratio of unloaded Q to loaded Q. It is the ratio of loaded Q to unloaded Q that sets efficiency. Even if inductor Q drops to 50 or less on ten meters, efficiency and power handling is usually much better than on 75 meters where inductor Q might peak.

> Small-inductance coils should have
>fat tubing or wide strap for the conductors, whch you don't get with
>a roller inductor.

Certainly not flat conductors! Flat wide conductors force current out to the edges, the center area of the strip carries almost no current. Not only that, the useless surface area adds needless undesired capacitance. I just measured an edge wound roller inductor, and it had lousy Q and a very low series resonant frequency! With #8 wire, the same inductor had nearly 80% more Q than with a silver plated flat 3/8 inch wide inductor.

Optimum Q for higher frequencies generally occurs with wire sizes between number eight and 14 are used. Large copper tubing coils often have LESS Q than coils of much thinner wire in applications requiring high self-resonant frequencies. With copper tubing, the thick conductor requires use of a larger diameter winding, pushing the length and diameter larger. A physically larger coil usually demonstrates increased distributed capacitance and radiation losses, as well as flux leakage and increased eddy current losses. The only place where I've seen copper tubing coil produce Q's over 300 is where frequency is at the lower end of HF where they are heavily loaded with intentional external capacitance and have a lot of physical space around them.

>Finally, the contact resistance of the sliding or
>rolling contact can easily be large enough to affect the Q. For example,
>a 1 uH coil with a Q of 1000 on the 40 meter band has a series resistance
>of only 44 milliohms. Any extra series resistance will kill the Q.

I'd like to see a 1 uH inductor with a Q of 1000!!! The highest Q inductor I've ever measured had a Q approaching 400, and that took a lot of work. If the rolling contact was the primary source of dissipation (ie, Q loss or resistance), it would quickly overheat and be destroyed. The real loss of Q is from multiple causes. The reason why rollers, as a general rule, offer less performance in applications requiring high Q, is becasue of the distributed capacitance, necessity of sticking undesirable things in induction fields (both electric and magnetic fields), and to a lesser extent the lack of proper form factor.

>: Roller Q is absolutely NOT a problem of cabinet size
>: or anything external to the roller, it is a problem of materials used
in

>What you really don't want to do is get any ferrous material in the
coil's
>magnetic field.

First of all, most rollers have large metal end plates (notice I don't care if it's steel or gold). They have a wheel in the field, they have metal shafts and thick dielectric supports. All of these things reduce the effect of external objects.

The Q change of an high Q airwound coil decreases much faster than a roller does when placed in any metallic cabinet.

The rapidly time varying field could care less if the metal is ferrous or not. Eddy currents prevent any RF external magnetic effects. The real problem is the surface area excited by magnetic flux and the resistance of the material.

>When I was working on the L-75 amplifier, I had used
>steel screws to mount the main tank coil. They got way too hot to touch

>in just a few seconds of amplifier operation. I replaced them with
>brass screws which ran cool as a cucumber.

The reason brass runs cooler is its resistivity is less than 10% of some steels, it has nothing to do with the fact it is non-ferrous. Eddy currents prevent any magnetic effects from occuring due to ferrous nature of the metal. Had you used lead screws, they would have been as hot as the brass. Had you used iron screws, they would have been almost as cool as the brass. Stainless steel screws that you couldn't pick up with a magnet would have gotten much hotter. it all relates to the RF resistance of the material, not the magnetic properties.

So far as Q loss.... brass, aluminum, steel, copper or even silver will kill the Q of a coil when the material is placed in the wrong area. Any metal placed near the coil increases stray capacitance and acts like a shorted turn, reducing inductance and lowering Q.

Any cabinet wall or metal placed too close to a coil....be it gold, steel, copper, or aluminum...will kill Q and efficiency. ALL cabinets should be kept away from RF coils. The performance difference caused by the "type" of metal is often immeasurable, it is the distance that really matters.

and
>design the capacitor accordingly.

In any tank circuit, currents and voltages are greatly affected by load impedance. That current has to come from somewhere, it doesn't just "pop-up" at the output port. That includes the pi-L.

For example, I have a common point impedance of 12 ohms in my 160 meter array. A number eight coil in a pi L circuit (used for bandwidth considerations) connected to the low Z output terminal gets so hot it actually stinks. The pi-L network in the MN-2700 would be just as bad, since it would have exactly the same current in the last inductor as my L

network.

Unless the MN 2700 used a number eight air wound inductor or larger, my 160 meter antenna (or any other antenna with a low impedance) would murder it.

The MN 2700 was a good tuner, but it is no exception to network theory. The guy with the X-match complained also, but the number 12 or 14 inductor in the X-match would become history when feeding my 12 ohm load. I can guarantee there are a lot of hams that have even worse loads on 160 and 80.

Well, there you have it, another 'take it or leave it'
deal from the ARRL. Ever think to look for a different
software supplier? That probably wouldn't fit within 'normal'
either.

O.K. I'm ready to listen to some science.

I'm trying to understand a bit about A/D
conversion prior to the DSP section in a
receiver.

For a 455kHz IF and a BW of interest of 16kHz
what are the drawbacks of sampling at 447kHz?

To improve your dummy load for VHF and higher get about a hundred feet
of RG58 (or more) and put your load on the end of it. The loss of
the cable will be high at high frequencies and will still be 50 Ohms.

So far as I know (as of today) Svetlana does NOT manufacture 3-500Z's. The alternate sources are Eimac, Amperex, and Chinese tubes that are sold under various labels.

Eimac and Amperex are both good quality tubes for power amplifiers, and the Chinese 3-500 makes an excellent fishing line bobber if you cast it very gently so the weak envelope doesn't shatter.

Too bad about your scope, for it is truly one of the great
classics

"Great"? "Classic"? Hardly!! There are a few early Tek scopes
(pre-465) which could be described with one or both of those
adjectives, but the 551 sure isn't one of them! 511, 545A, 547
maybe, but 551? Abomination would be a better descriptive term
to use. Most people who have worked on 551's would agree that
the 551 serves only to remind us how primitive the technology was
in those days. The fact that something is old does not
necessarily make it either great or classic. Don't let nostalgia
cloud your common sense.

>have resulted in "I heard it from. . ." but never a pointer to an
>authoritative source.

Look in the CRC Handbook of Chemistry and Physics. There is a table entitled
"Resistivity of Semiconducting Minerals". Silver sulfide (argentite, Ag2S) has
a resistivity between 1.5E-3 and
2.0E-3 ohm-meter. If you could turn it into 22 gauge wire, its resistance would
be about 1800 ohms per foot. Copper oxide (Melaconite, CuO) has a resistivity
of 6000 ohm-meter.

For comparison:
resistivity resistance of 22 gauge wire
Silver metal 1.6E-8 ohm-meter 0.050 ohm per meter
Copper metal 1.7E-8 ohm-meter 0.053 ohm per meter
Silver sulfide 2.0E-3 ohm-meter 6000 ohm per meter
Copper oxide 6.0E+3 ohm-meter 18,000,000,000 ohm per meter

Exposed silver tends to form a sulfide rather than an oxide. Exposed copper
will form an oxide.

In my experiences no it wont. There are plans for an antenna of
the folded dipole type but for the 137 MHz band in The Satellite
Handbook and it works quite well so i see no problems at all
using PVC to shroud a antenna at lower frequencies!

Depending upon the vehicle in question, what are called "bungee cords"
(elasticized rope with hooks) in the states might be a solution for
holding the mobile rig in the vehicle attached to let's say the center
column under the ashtray in most vehicles I've seen if the mobile rig is
small enough? Finding a good source of power may be a bigger problem as
even if you have a cigar lighter outlet, you probably will have ignition
or alternator noise. Other possible spots include between the two front
seats and strapped down once again with bungee cords.

I assume you'll either be using a through the glass antenna, or
alternatively a mag mount antenna for your antennas to prevent drilling
holes.

I might also say that there are restoration specialists, who can cover up
any holes in the vehicle if you're going to be using it for any long
length of time, especially for passing power directly from the battery to
power your rig! 73 de n8blk/3 -art clemons-

Yea really! Try tuning a 120 long center fed on 160 meters! I managed
to do it by using the link and associated tuning caps from the final
amplifier of a scrapped out 1 KW AM broadcast tranmitter.

I asked one of my metallugical engineer friends about this. He *thought* (no experimental evidence) that silver oxide would be a semi-conductor.

Now if somebody wants to donate some precision air-line coax with silver center conductors that I can oxidize, I will gladly make before and after measurements on an HP8510C network analyzer and we can put this to bed.

Any takers? I didn't think so. <g>

I can't quote anything on this except the statement I got from my
"Elmer";
the oxide conducts just as well as silver; evidenced by the fact that
crappy
oxidized N/BNC/PL-259 connectors work just as well as clean new ones!
Stuff
that in your empirical pipes and oxidize it!

: > references to "tappers" and other key-wound mechanisms designed to > agitate them.
: The HF signal triggered an (increase of) electric current in the circuit
: that the coherer was part of. Because the granulate remained stuck
: together a mechanical means of separating them was needed. Therefore,
: the current (typically a received morse code signal) triggered a
: solenoid that activated a little hammer, that tapped the glass tube to
: shake loose the granulate.

: Those were the days...

: 73 Frank PA3GMP

There is evidence to indicate that one coherer that Marconi used
here in 1901 for the transatlantic experiment behaved as a diode.
It was called the Italian Navy coherer and comprised a drop of
mercury between two electrodes.

Dear Frank

for a totally "portable" installation, I built a small (20x20cm) flat fixture with four suction cups that stick on the windshield. The CB is then mounted under this fixture. I power the CB from the lighter plug and use a magnetic mount antenna. This installation is very flexible, and you can usually find a spot so the your visibility is not obstructed. I made the fixture out of clear plexiglass, so it does not look too terrible. One dissadvantage is that the CB is very visible from the outside, so I do not leave it there when the car is parked.

355. Converter from TTY to RS232

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-10 00:00:00 UTC
From: d-cripps@dircon.co.uk
Message-ID: <5b516j$7pp@newsgate.dircon.co.uk>
Source record: 98756

I,m trying to build an interface to connect
my AR8000 or my Opto Cub to a serial port
on my PC, with the power being drawn from
the RS232 interface.

Both AR and Opton use TTY input levels
(the 8000 is full duplex the Scout half
duplex CI-V).

If possible I'd like to fit the lot into
the headshell of the 25pin plug!

One design I've seen uses one small chip
to convert 232 to TTY, one voltage regulator
and a diode for protection (see below)

I've heard of other designs (Edco and JCom
come to mind). Any hints/ideas/suggestions?

TIA

Dave Cripps

Signals are in the microvolt to milivolt range. The frequencies
are from 1 Hz to 50 Hz. An oscilloscope probably won't be suitable
unless you make a preamplifier to boost and filter the signals.

>are found.
>
>Gary

Actually, lower resistivity isn't necessarily better. If the resistivity is zero, there's no loss because it's a perfect conductor. If it's infinite, there's no loss because it's a perfect insulator. There's a value in between at which the loss is greatest, and it decreases with higher or lower resistivity. The magic value depends on the coating resistivity, thickness, and frequency. As the resistivity increases, so does the skin depth. A thin, highly resistive coating won't have much current in it, hence won't have much loss. An example is aluminum oxide which quickly forms on any aluminum conductor. It's thin and an excellent insulator, so contributes no appreciable loss. The problem is similar to one of impedance matching.

I'll try to shake some time loose to look up references for current distribution or loss in plated materials. As I recall, it's not a simple problem. I suspect that both copper oxide and silver sulfide are sufficiently highly resistive that neither will contribute appreciable loss at HF and above, unless the coating thicknesses are greater than I think they'd be.

I'm not much of a chemist, but it seems that an important issue is whether the oxide is porous (as with iron oxide) or non-porous (as with aluminum oxide), since a non-porous coating would limit the depth of the coating.

Incidentally, copper sulfide is common in some industrial environments, and copper chloride is common near the sea. I know copper chloride is non-porous; exposure to salt air will turn wire into powder.

From: vincebucc@aol.com
Message-ID: <19970111202400.PAA26804@ladder01.news.aol.com>
Source record: 98648

I have degutted a very old rotary desk telephone unit. I think it is Western Electric. Dates back to about 1962.

Inside I find a black box that has labeling:

C NET 425B and is date-stamped 12-62.

The telephone line cord has Red @ term L2, Yellow @ term G and Green @ term L1.

The handset coiled line cord has White and Red @ term R, Black @ term B and White @ term GN.

The Hook-Lever switch mechanically controls a relay type device that has several wires going to other terminals on the CNET 435B box.

Other terminals on the box no longer have wires connected; they probably had wires from the ringing device connected at one time. Too long ago for me to recall now.

I would like to find out any and all info about this box. I am thinking that I should be able to make use of it as the main element in a telephone interface/phone patch. My intent is to interface HamComm generated tones (avail @ RS232 level on COM port of my PC) to the telephone line w/o disturbing the telco lines.....

I cannot be certain that this item is still in working order, as the telephone no longer worked when I put it aside. If schematic info or functional block diagram is available, please get in touch with me. With this info, I hope to check out the box and put together a suitable switching circuit.

Thanks.

My friend KA9DQQ (Dick) has the below equipment for sale.
He resides in Wausau, Wisconsin USA

Ten Tec Model 705/705A Electret Condenser Microphone
Ten Tec Model 585 Paragon All-Band HF Transceiver
Ten Tec Model 253 2 Kilowatt Automatic Antenna Tuner
Ten Tec 9420 Power Supply
Hercules II Model 420 Solid State Linear Amplifier

All Ownerï¿½s Manuals Included.
System Completely Rack Mounted.

Price $3,600.00 Plus Shipping/Handling/Insurance.

I am posting this for him, please call him for any additional
information.

Pricing on above equipment should be confirmed with KA9DQQ.
Final price is subject to his approval.
I reserve the right that if a typographical error occurred, it was
not made to misrepresent KA9DQQ or misguide the reader of
this posting. Laymanï¿½s termsï¿½ I am not the best of typists.

KA9DQQï¿½s personal information is as follows:

Email: elmer5@juno.com
Phone: 715-848-8095

Thank you for your time and attention.

You need a high-gain differential amplifier and a tunable low-frequency
bandpass filter. Without the filter you will pick up alot of noise. I built
a biofeedback monitor in about 1974 from a Popular Electronics project that
was essentially this. I was able to view alpha waves with it. Can't help
you on the actual levels but they are probably in the microvolt level.
Maybe someone out there has a Popular Electronics collection with that
article.

My CRC Handbook is the 70th edition (1989-1990). The table is on page B-205.
Apparently CRC got this table from the "Handbook of Physical Properties of
Rocks," Vol. I, CRC Press, 1982.

> The data you quote turns the commonly-heard statement about the
> conductivity of silver sulfide from an urban legend to a very wrong
> statement.

Actually the conductivity is not that bad if the sulfide layer is relatively
thin compared to the contact surface area. Still, silver metal should conduct
100,000 times better than argentite. (And argentite conducts 3,000,000 times
better than copper oxide.)

I don't know what chemical or physical differences there are between the mineral
argentite vs. tarnished silver.

: : voltmeter.

: : Gary Ritter...N2EAL

Check the wiring for the meter at the meter function switch.
I had a bias reading that was incorrect and when I thought
I was setting the bias current for the finals to 50mA it was
really about 350mA. Confirm this at the cathode resistor
for the finals. The two 6146's use this common cathode resistor.
You probably took a voltage reading at the resistor and found
the current. My problem was a cold solder joint. Probably
why your meter appears dead or reading incorrectly.

That was only one of 8 problems I found. Bought mine
here on the net. 'Worked the last time I turned it on.'

He didnt say that that was 25 years ago.

w7el@teleport.com (Roy Lewallen) wrote:
> Where were these experiments done?
They were done at Continental Electronics in the late 70's by Witt Griffith. Witt retired a few years ago. Connie Hardin participated with Witt in the research and related the information to me. (Sometimes I think Connie has a copy of every paper ever printed; he's also the one with the obscure text you need. He even has a copy of my favorite little amplifier tome by V.O. Stokes; I thought I was the only one outside of the old timers at Marconi who had that one.) The original question came up in connection with coil clamps on silver-plated coils that had tarnished. I was surprised that they found silver oxide conductivity "..at least as good..." as silver since we have problems with low-level signals when silver contacts are used. The sulphur in the silver tarnish must be a good fertilizer for organic material growth at these points. According to the guru's here, all sorts of bugs grow in the tarnish and their colonies are responsible for the contact resistance.

Hi Mr. Teddy bear,

I know this is not the design that you requested, but here it goes.

Due to your "dream like" gain figures for this antenna, I recommend a supercooled,
superconducting bifilar helical antenna. By using superconductive wires, you
should be able to make the resistive losses of the antenna equal to zero. This
should greatly increase the performance of the antenna.

... or you could use a yagi array. Let's use simple math to calculate the number
of antennas required to achieve 30 dB of gain. For this example we will use a
cushcraft antenna (13B2) with an approximate gain of 14dB. If you were to
connect n of these antennas together, the gain would increase to 14 + 10 Log (n).
If we assume that for every antenna there is a loss of .25 dB in feedline and
splitter losses, the above formula becomes 13.75 + 10Log(n) = 30dB. Solving the
equation for n gives us :

n=10^1.625
How many antennas do you need?
42.17 antennas
Since antennas come in whole units, I recommend you use 42 cushcraft antennas
and 1 MFJ antenna. This should approximate the requirements. Care should be taken
as to not skew the antenna pattern. I recommend placing the MFJ antenna dead center
of the array. Actual results may vary if you use Radio Shack CB cable.

On a last note,
If you decide to go with the supercooled, superconducting bifilar helical antenna, I
recomment that you build two of these antennas with opposite polarization. This will
enable you to hear your own echos. See you on EME!

73's

P.S. You owe me $300 in design fees... Puto!

Ever thought that sometimes you cannot afford not to pay.
A thought as a Dedicated Mac user and a Dedicated Ham.
Charles KD4HHX

Unfortunately, only one user out of 14 uses a Mac. Are you willing to
pay 14 times as much for the software?
That's based on the fact as stated in the SF Chronicle business
section that Apple has fallen to less then 7% of the PC market, due to
their perceived instability.

If the format of the data is available, then maybe a Mac user, a Unix
user, a DOS user on an OS-2 user will do the right thing.

Paul,

Thank you, thank you! As I mentioned earlier, I've looked for years for this information without success, including in my CRC Handbook. Although it's terribly hard to find anything in this book, I'm pretty sure it's not in my 59th edition. (It does have a table of semiconductor properties, but not including resistivity.) What edition did you find it in?

Thanks again!

The data you quote turns the commonly-heard statement about the conductivity of silver sulfide from an urban legend to a very wrong statement.

Actually, this is also proof that tin and lead conduct as well as silver.
When I slop solder all over the outside of the PL-259 (which I frequently
do), it still works as well, too.

Consider it stuffed and oxidized.

Well, if you make the measurement at say, 20 MHz on a well-tarnished
piece, then remove the tarnish and do it again, the difference should
at least be sufficient to verify whether the legend is true.

Oh I see Teddy, now I'm curious about this connection between rewarding CW skills and unsolicited opinions and conjecture. Do you have some research showing this connection or is this just YOUR UNSOLICITED OPINION?

Additionally I'd love to see what FACTUAL INFORMATION you have showing why hams build or buy. According to you, they buy because we have emphasized CW instead of engineering. For the record I have no formal education and my entire ham shack is either kit or homebrew. Was this just YOUR UNSOLICITED OPINION?

> Amateur radio is a SCIENCE, not a realm of personal opinions! We are
> SUPPOSED TO BE following in the footsteps of SCIENTISTS, using FACTS!

It's not defined as a science by the FCC, they are the folks who issue licences.
They call it a SERVICE.

Teddy, the hobby or "science" as you prefer has changed. Sorry! And again thanks for sharing your PERSONAL UNSOLICITED OPINIONS on why hams buy instead of build and why emphasis on CW has caused unsolited opinions based on conjecture. Very interesting observation.

Sheeesh, go design a tranciever or something. I need a new winter project.

Well, to be fair, the RCA TT50H did use rheostats to set the filament
voltage. The meter didn't have a normal operating range marked though.
The H-line was junk, however, and tended to burn up *everything* from
time to time, including rheostat brushes. It also had the most Rube
Goldberg tuning arrangement I've ever seen, and the packaged bias supply
was marked for use with model train layouts. Arrgh!

>to achieve best MDS.

It doesn't matter what we think, it only matters what it is.

Most receivers do not have bridging inputs for several reasons.

The main one is input filters require termination to maintain correct
frequency response.

Second, an improper high Z termination would allow the transmission line
length to wildly control voltage appearing at the open end of the line. On
some frequencies there would be a large step-up of voltage at the receiver
end of the line, and at others a step down of voltage. That would
radically change the receing systems sensitivity with frequency. Remember
it is the receiver that sets the systems SWR when receiving, not the
antenna. I use this effect to advantage in my very broadband arrays of
multi-element phased receiving loops.

>>If the capacitor passes HF RF, then I suspect it is almost useless for

>is 350volts/2nS or more. That allows the gas tube time to fire before the

>surge gets clamped by the receiver input shunt impedance, IE a cavity or
>helical filter with an input loop.

I have trouble understanding what you mean. The capacitor is in SERIES
with the transmission line. Current leads voltage, so the capacitor looks
like a short at the first application of voltage. Only after the capacitor
charges, can the gas tube fire.

If the capacitor was in SHUNT with the feedline, it would help. But it would also reduce desired signals.

What did you mean by the above dV/dt thing Gary?

Mr. Trevor Hopps (VK8TH) has taken it upon himself to report me for Email Abuse. Since I really don't know what law I have broken, I'd like for him to explain himself to me. Who did he report me to? For what? Language? Is this not the internet? Who is policing it? Why? If I was using abusive or offensive language over the air on a ham band, I could see his point. BUT, THIS IS NOT THE HAM BANDS. THIS IS THE INTERNET. He left me no Email address to reply to him to counter his accusation. I am apparently GUILTY until proven otherwise in this US of A!!

Mr. Hopps states: "The type of critisism and language contained in your email is not fit for public consumption."

This is YOUR opinion Mr. Hopps. Who are you to police what I write? If you do not like my use of 4 letter words, a polite email would have done much more than this "I tattled on you." email. I would like to debate this issue further with you. I will not use any abusive language at your previous request. However, I would like to discuss the reporting of my email address to whoever you reported it to.
Thank you
Tyler

Zack Clobes <zclobes@southwind.net>
shared these priceless pearls of wisdom:

->I'm working on a 20M SSB receiver and I'm working on the IF amplifier.
->I chose to use the mc1350 because of it's simplicity.

Others have posted on the circuit design question you asked. One thing you need to be absolutely aware of is that the 1350's gain goes to hell in a handbasket when Vcc is less than 12 volts. It is a nice stable device at 15 volts, pretty good at 14, marginal at 13, and rolls off the table like an orange at 11.9999....

Vince, I've done this, unfortunatly I don't have any documentation to offer. There a tons of 300 and now 2400 baud modems (external are prefered) that you can pick up for a song or $5, that already have the audio transformer and audio amps built in. Since the Hamcomm program has the capability of reading audio tones directly you can simply tap into the sections on the pc board where those signals are present.

I did it with an old 300 baud modem, keep in mind the baud rate is not important since your not using the modem's tones. I played music in to a telephone with the modem connected at the other end, using a old tube signal tracer I found several spots where the audio was I took a tap from the strongest one, thats my RX. I tried to pick a spot that was just on the other side of the transformer. I did the same thing for TX, I put the hamcomm in the rtty mode and let it fly, I probed with the audio signal on a couple op amps close to the transformer and voila, Hamcomm tones on the other phone.

I did have to power the unit for it to work and I did have to cut a few traces to keep the modems tones from interfearing but it was worth the effort. About 2 hrs of work, and my project was already in a box!!

Good luck,

Tim, ka8ddz

Uh, actually no Teddy you did not. Are you forgetting what your original post said?
Where exactly is the warning? Your starting to drift on us Teddy...

I bet your the kind of guy someone could give a million dollars to and you'd bitch cause you had to pay the taxes on it!!

Can ANYONE here give me a computer-designed plan to make a beam antenna that
fits the following "rough-draft" parameters?

A 30 turn, logarythimic-spaced, Right-Hand Circularly-Polarized (RHCP) beam
antenna for 144.3 MHz, on a manually-swiveling rear-mount boom,(made of 2" OD Aluminum tubing), with a mono-filar element,(made of bare #6 solid copper wire, commonly used by electricians as ground wire for a building's
main box), with insulating "spreaders",(made of either 1/2" PVC, fiberglass
rods or wood dowels).

My idea is to mount the boom vertically on a universal joint, which itself is mounted atop a 10' mast,(5' of the mast actually being below ground level in concrete), and to use pullies and counter-weights with the
non-conductive guy ropes to actually TILT the antenna at the moon,(using a boom-mounted 3X rifle scope to aim it), so by turning 2 lockable cranks
I can track the movement of the moon manually anywhere in it's path anywhere within 60 degrees from plumb,(by "plumb" I mean an exactly vertical position). The mechanics of it are much the same as those of the
older mobile cranes they used to use on rural construction sites.

BTW: I am not open to the idea of using a yagi, so please don't suggest it.

Please reply via both, the newsgroup and email.

Thank you.

Actually, Roy, if his data is correct (not in my 47th edition of CRC either), it means that oxidized or sulfided silver is about 6 orders of magnitude more conductive than oxidized copper. Thus it clearly demonstrates the advantage of silver plating copper in any environment which isn't oxygen free, such as those where our tank coils and cavities are found.

Hi Gary,

Most of what you say below is very nebulous, and does not support any claims.

In article <1997Jan12.163113.18881@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us (Gary Coffman) writes:

>Well, in the IC-735 the filter bank is terminated by R29. The signal
>is then top coupled into the first RF stage input tank by C354. In
>other words, the first RF amp bridges.

It bridges a RESISTOR. What is the value of the resistor? What is the input impedance of the amplifier?

>In the IC706 the HF receive
>filter bank is terminated by R10 with IC1 bridged off of that via R11.

That one I can measure. The input impedance of my 706 is nominally about 100 ohms, although it varies with frequency.

>My Drake 2B and National NC-190 don't even pretend to offer a 50 ohm
>match.

My Drake 2 B does. When the preselector is tuned to resonace the input impedance is 20 ohms j zero on 80 meters, my NC-300 is 70 ohms on 80 meters j zero when resonant.

>The screw terminals for the antenna connection go to loose
>coupled tuned circuits in the preselectors, IE they present a high
>impedance load to the antenna.

Loose coupling? How do you know that without measuring it?

>Now all of my VHF and UHF receivers appear to try for a power match
>with the input of the first active device, but none of my HF receivers
>do.

Mine all do, including my 751A (20 ohms unless the pad is in, then it's 50). My R4C does, 35 ohms j zero at resonance on 160. My 706 does, my NC300 does, my 747 does, my 706 does, my Heath Mohawk does.....

>As I noted above, at VHF+, internal noise determines the floor of
>the receiver, so as much signal power as possible must be coupled to
>the first amp to overcome that. But at HF, atmospheric noise dominates,
>so a power match is not needed, and would hurt strong signal handling

measurement.
>
>Those examples don't cover the universe of HF receivers of course,
>there may be some which do attempt to power match to the first
>active device. I haven't examined one that does, however.

If you say so.

The absolute fact remains if the manufacturer did NOT attempt to terminate
the input:

Ripple would be very bad in the filters
Sensitivity would vary wildly with frequency and transmission line length.

>>I have trouble understanding what you mean. The capacitor is in SERIES

>capacitance and inductance, and Rx is the reciever input impedance.
>If Cs were directly shunted across G, the gas tube, then it would
>behave as you say. But as you can see, it isn't.

Wait a minute. **I'm** the one who said capacitor Cs was in series. No
matter what, it can ONLY speed up the response time of the path to the
receiver. It can not possibly slow down the response time of the receiver
path. That would require an inductor.

Cs does NOTHING good at the leading edge of the waveform. It would take a
series inductor to do that! It does limit the steady state or low
frequency response, but to say it allows the gas tube time to ionize
BEFORE coupling energy to the receiver is a complete mis-statement.

I've never seen powdered iron in rod form, but I've had
pretty good luck making my own rods by stacking up small
toroids on a plastic rod.

Just out of curiousity, why do you feel that ferrite
wouldn't work in your application? IMHO, anything you
can do with powdered iron can be done better with ferrite
except for inductors with DC bias. However, I am willing
to learn about the merits of powdered iron if I am missing
something here.

and for that matter, the existing Mac operating system may also be
heading for the scrap heap with the NeXT acquistion. off hand, w/o
actually getting a disk and looking at it, it appears that it's not
hopeless given jon bloom's description of what was done. does sound like
the information is in a format that should be readable in some fashion
on any computer. having an index tool could be more of a problem.

Jobs lost the macintosh war when he failed to include some inexpensive
way
to expand the capacity of the original mac. sure all the shortcomings of
the orginal 128k machine have been addressed and all that, but those
that reviewed the initial machine some 10+ years ago and dismissed it,

probably still think it's the same closed shop box.

Microsoft will lose the dominance of the desktop just as soon as Gates can force companies to pay for his software by the number of seconds it's in use plus a fee for every computer connected to a network..

No, there is an optimum source impedance which the active device wants to see to deliver the lowest noise figure. More often than not, the input match is very poor. I have seen VSWRs of >6:1 on some LNAs. This is a terrible match, but delivers the best noise figure.

This property also gives rise to considerable uncertainty in the measurement of noise figure; a property often overlooked by those who quote NFs to 0.01 dB accuracies. But all of this is the subject for another thread, isn't it.

I've personally seen copper wire turn into green powder at a location on
the coast. It was suspended, so I don't believe there was a path for
electrolysis.

:>> AF4Z@TNG.NET
:>
:>You might try Peter W. Dahl in El Paso. 915 751 2300. However, to the
:>best of my knowledge, he does not make current-limiting type transformers,
:>like the one Heath used---

Did you even bother to check the Dahl catalog?

From the Peter Dahl amateur catalog available at www.pwdahl.com shows:

| HEATH SB-220 FILAMENT XFMR EXACT REPLACEMENT TRANSFORMER EI-137 X
| 1.375 05 6 $88.00 PR) 120/240 VAC 60 HZ 1 PH S1) 5.0 VCT @ 30A CCS
| S2) 90 VAC @ 0.1A CCS DM) HT = 3.438 WT = 4.125 DT = 3.108 MD =
| 2.750 MW = 2.375 WT = 5.8 LBS

Since Dahl builds replacement transformers for a wide variety of high
power commercial equipment, I expect "EXACT REPLACEMENT TRANSFORMER"
means exactly what it says and that the performance characteristics are
identical in every way to the original.

:>products that would provide the capabilities we need, we'd use them.
:>We've not found any such as yet. (We're always interested in hearing
:>about any you know of.)

Netscape Navigator, Microsoft Internet Explorer, the various flavors of Mosiac, are about as inexpensive, off-the-shelf, and multi-platform as one can get.

:>Ummm... how does one implement a searchable database in HTML? You need
:>an HTTP server with CGI and a database application. And of course, that
:>software would have to be multi-platform.

Every browser I've looked at (Netscape Navigator, Internet Explorer, IBM's Web Explorer for OS/2) all support searching a document. With that support in the reader, one need only provide a properly (HTML) coded index much like the annual index already included with QST.

A significantly expanded index is almost trivial using the indexing functions of modern word processors (all of which will create an index over multiple documents or chapters).

:>The image files on the QST View CD-ROMs are standard TIFF files (using
:>CCITT Group 3 compression). And the database for each set is contained
:>in a comma-delimited ASCII file on the first disk of the set. (The file
:>contains a few SQL engine commands you can ignore.) If some enterprising
:>Mac (or OS/2, or *nix, or...) software type wants to write an
:>application for his/her favorite platform that will search and display
:>the files, I'd be delighted. Heck, I'll gladly make it available from
:>ARRL's Web site. We just can't afford to *pay* anyone to do it.

Your requirements sound rather easy to accomplish, at least for OS/2, using V-REXX and the graphics display capability (MMOS/2) built into the operating system. I'm sure nobody even bothered to check it out before pressing the CD.
It's a shame I don't have the V-REXX developer package and a little free time.

Another option to consider ... since QST is typeset with a Psotscript process, if you DON'T use HTML, save the postscript source and convert everything to PDF files. The CD can be published using ADOBE'S ACRROBAT. Acrobat readers are free or low cost, are available for a large number of platforms, and are rapidly becomimg a portable standard. I believe that Adobe also include functions for generating indexes and tables of content.

We all have to start somewhere. Check with your local Radio Shack, or other electronics parts store and find out if there are any clubs in your area. Many clubs are more than happy to help folks just like yourself find out more and help them get their license. If you don't have any stores in your area, often the engineers at local radio or TV stations are also Hams and can direct you.
The other responses to the question are very good.
Good Luck and hope to hear you on the air.

This is not amateur radio, but is pertinant to silver sulphide.

Silver Sulphide is a disaster in a telecommunications environment.

Back in the 1960s I was involved with the changing of a manual exchange to an automatic one at our (New Zealand) resort town of Rotorua. The air in this town has a very high H2S concentrations from local geothermic activity.

The maintenance effort on the manual exchange was very heavy as the silver switch and relay contacts, and the plated plug and socket contacts were continually being sulphided causing noisy connections and poor speech. Silver contacts would drop out of nickel silver springs.

The administration were very concerned that an automatic exchange with its multiplicity of contacts would not be a maintenance nightmare.

The new automatic exchange was a step by step exchange from Ericssons of England (at that time, we were committed to the English step by step exchange systems, Crossbar and electronic were years into the future). It was of conventional construction except that critical contacts were to be of palladium which is more resistant than silver.

We chose to pressurise the exchange building and pass the air entering the building through activated charcoal filters which removed the H2S by adsorption.

Also, the switch racks were enclosed covers behind which air which had been subjected to a third stage of filtering was circulated.

I was heavily involved in the air conditioning filtering systems in the building and for a time was THE expert in H2S removal from air in the coountry. Years later the system was still doing its thing and there were no problems with contact contamination in the exchange.

BTW, TV sets had a heavy mortality from H2S corrosion.

EPILOGUE (?)

I guess you could say that Tom Rauch and I didn't exactly hit it off from the git-go---i.e., when he telephoned me in 1990 at the urging of QST's Paul Pagel. The telephone rang. The caller identified himself as Tom Ranch and somewhat brusquely demanded to know whether I was tape recording the conversation. I said "no". However, "no" apparently wasn't good enough for Mr. Rauch, so he pressed me on the matter. After repeated assurances that I was not recording the conversation, he began to talk. Mr. Rauch was evasive about the issue of parasitic-oscillation in amplifiers he designed, such as the SB-1000 and the AL-1200 (which I knew had exhibited what appeared to be VHF parasitic arcing during testing in the ARRL lab). When I realized that this route was a dead-end, I tried discussing the SB-220---which Mr. Rauch did NOT design. This seemed to do the trick . Mr. Rauch loosened up. He said that he had worked on over 400 SB-220s and that he had seen plenty with parasitic damage. I asked Mr. Rauch why amplifiers he designed don't oscillate, while other amplifiers like the SB-220 occasionally oscillate? He said that they don't oscillate because Tom Rauch designed them. However, when I asked him how does one go about designing a stable amplifier?---he made statements that didn't seem to wash. When I pointed out that the SB-1000 and the SB-220 use virtually the same VHF parasitic oscillation suppressor design, Mr. Rauch 'lost it' and he began shouting. // When Mr. Rauch later denied this, I realized that henceforth anything he said probably needed to be checked out. Nevertheless, I was surprized when I struck paydirt on the first thing I decided to check out in this debate---the alleged 'R+D engineering manager' at Eimac's Salt Lake City plant who turned out to be an 'Engineer B', who apparently disagreed with most of what I wrote in QST, who still has not appeared on this debate as proffered.

Free, unsolicited advice:

1. Anyone who demands to know whether you are tape recording the conversation, is not trustworthy.

2. The surest way to become marginalized in a debate is to prevaricate.

3. If you want to be an "amplifier expert", it helps if you: understand algebra, trigonometry, scientific notation, and AC circuit analysis. You should know the capabilities of oscilloscopes, understand the difference between a true-RMS meter and an averaging meter, have a modicum of understanding about thermodynamics. However, most importantly, NEVER claim to be an "amplifier expert".

IMO, a milestone in this debate was the AC circuit analysis problem Mr. Rauch challenged me with:
An 85nH suppressor inductor (Ls) is in parallel with a suppressor resistor (Rs) of 100 ohms. At 160MHz, relatively how much current flows in Ls and in Rs. Presumably, Mr. Rauch *presumed* that this problem would prove that his statement in the 9/94 QST was correct. Mr. Rauch's statement:

"In a typical parasitic suppressor, the coil is in parallel with a low-value resistor. This combination is in series with the signal path, usually in the anode circuit between the tube and the plate tuning capacitor. The coil's reactance increases with frequency, and at VHF most of the signal path is through the resistor."

However, when the calculated VHF current in Ls turned out to be about 10% greater than the calculated VHF current in Rs, in Mr. Rauch's own problem no less, he quickly dismissed the results for technical reasons that did not make sense. Apparently "amplifier experts" are unlikely to admit to making mistakes, and some of them seem to cover their mistakes with techno-blather

IMO, another milestone in this debate was when Mr. Rauch quietly cancelled his post of 28 November. In this post, Mr. Rauch estimated that an Ls made from Ni-Cr alloy (nichrome) wire might exhibit 5 ohms of ESR at VHF. At first glance, a few ohms of ESR in Ls does not appear to be significant---especially if one *presumes* that insignificant VHF current flows through Ls. However, Wes Stewart's measurements** show that at 100MHz, a typical Ls made from nichrome-60 exhibits 1.73 ohms of ESR. When this Ls was paralleled with a 100 ohm Rs, whose ESL=9nH, Wes measured a parallel equivlent resistance (Rp) that was about 61% of the Rp that a conventional (W8JI) parasitic suppressor measured. The VHF Rp on the anode controls the VHF voltage gain of the amplifier. More VHF Rp means more VHF voltage gain. Theoretically, this means that the VHF voltage gain obtained when a low VHF Q (Ni-Cr alloy Ls) suppressor is used is about 61% of the VHF voltage gain of when an otherwise similar, conventional (W8JI) parasitic suppressor is used. However, this is not the whole story. As those of you know who have installed a 'low VHF Q parasitic suppressor retrofit kit', the parasitic suppressor is not the only item that is replaced in the anode's VHF-resonant circuit. Most of the 'heavy-duty' copper or silver strap and buswires in the anode circuit are replaced with parallel, unequal-length Ni-Cr alloy wires spaced about

1cm apart. This adds additional VHF ESR to the anode resonant circuit, which additionally decreases Rp, which additionally decreases the VHF voltage gain of the amplifier.

I am gressing that the reason Mr. Rauch cancelled the 28 Nov. post is that he somehow became aware of the effect a few ESR ohms in Ls would have in lowering Rp and lowering VHF voltage gain.

Mr. Rauch said:
"Rich, there is no point in continuing this. You apparently have no more technical points, ..."

VHF Rp (the parallel equivalent of an Ls/Rs VHF suppressor) is a technical point, if not the central technical issue of this debate. Now that we have Wes Stewart's measurements of Rp in a conventional (copper Ls) suppressor and Rp in a nickle-chromium alloy Ls suppressor, I think I see a light at the end of the tunnel. Will Mr. Rauch debate the central technical issue, or will Mr. Rauch try to flood the tunnel with smoke? I'm guessing that, henceforth, Mr. Rauch will cheerfully discuss anything and everything ..... except Wes' Rp measurements.

End

**Wes Stewart's parasitic suppressor measurements are available at:

>multi-element phased receiving loops.

Well, in the IC-735 the filter bank is terminated by R29. The signal
is then top coupled into the first RF stage input tank by C354. In
other words, the first RF amp bridges. In the IC706 the HF receive
filter bank is terminated by R10 with IC1 bridged off of that via R11.
My Drake 2B and National NC-190 don't even pretend to offer a 50 ohm
match. The screw terminals for the antenna connection go to loose
coupled tuned circuits in the preselectors, IE they present a high
impedance load to the antenna.

Now all of my VHF and UHF receivers appear to try for a power match
with the input of the first active device, but none of my HF receivers
do. As I noted above, at VHF+, internal noise determines the floor of
the receiver, so as much signal power as possible must be coupled to
the first amp to overcome that. But at HF, atmospheric noise dominates,
so a power match is not needed, and would hurt strong signal handling
in the receiver. For the HF receivers I have with fixed tuned filters,
a resistor terminates them. For the receivers with tunable preselector

filters, loose coupling is used. For my own little experimental I/Q receiver, I use a loose coupled tunable preselector. In all cases, the first active device bridges the source impedance just as a VOM bridges the impedance of the device under test when you take a voltage measurement.

Those examples don't cover the universe of HF receivers of course, there may be some which do attempt to power match to the first active device. I haven't examined one that does, however.

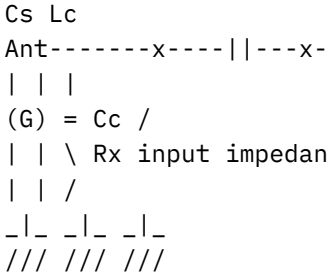
>
>I have trouble understanding what you mean. The capacitor is in SERIES
>with the transmission line. Current leads voltage, so the capacitor looks
>like a short at the first application of voltage. Only after the capacitor
>charges, can the gas tube fire.

Well, the circuit isn't exactly like that. Here is a crude equivalent circuit:



Cs is the suppressor capacitor, Cc and Lc are the equivalent coax capacitance and inductance, and Rx is the reciever input impedance. If Cs were directly shunted across G, the gas tube, then it would behave as you say. But as you can see, it isn't.

The capacitor looks like an open to the main body of the pulse, which is at a frequency equivalent of about 25 kHz, IE 10 uS pulse duration. The capacitor gives the gas tube time (less than 2nS) in which to fire before the receiver Rx can clamp the voltage to less than the gas tube's firing potential. When the tube does fire, it is a very low impedance short on the line and drains the accumulated charge back off the capacitor at the same time it shunts the main pulse energy.

You've got to remember that although we talk of the lightninq components as frequencies, because to a Fourier analysis they are, there is only a

unipolar pulse present at the protector *at all component frequencies*.
There is no +/- AC signal to couple energy across the capacitor as there
is during RF transmission. The only energy that gets coupled is the area
under the capacitor's dV/dt curve during the 2nS it takes for the gas tube
to fire. The receiver can tolerate that. It is a tiny fraction of a joule.

We don't need this capacitor unless the receiver input circuit has
DC continuity, such as via cavity filters or a shunt inductor.
Otherwise the capacitor input coupling of the receiver will serve
to prevent clamping the pulse to a voltage below the gas tube firing
potential. It is only in cases where the receiver has DC continuity
that the capacitor is needed in the suppressor. But it doesn't hurt
to have it there even if the receiver isn't DC coupled.

The main body of the lightning pulse can be considered as an 8000
ampere constant current source backed by a billion volts of reserve
potential. So you can figure its source impedance as about 125 kohms.
It would take a shunt capacitor of about 0.03 uF to yield 2nS delay to
the 350 volt level. What's actually used in a HF suppressor is a chip
capacitor of about 0.1 uF in series with the parallel combination of
the coax Cc and the series pair of the coax Lc and the receiver Rx.
So there is about a 3x (or greater) time margin for the gas tube to
fire before Rx could clamp the voltage below the gas tube's firing
potential and carry the bulk of the surge current itself. That's
what we're trying to prevent of course.

Maybe, just maybe, Tom got to wondering why everyone else's 8877 amplifier design has a VHF parasitic oscillation suppressor and his design doesn't. Thanks to Wes' measurements, Tom should be aware of an easy way of reducing the suppressor's VHF Rp, which reduces VHF voltage gain, which just might make the AL-1500 more stable, Phil.

True. This was my mistake. Tom and I also discussed the grid protective
circuitry of the AL1500 and he sent me a circuit diagram for same. I
incorrectly assumed the suppressor was also from that amp. It is not; it's
from an AL80B.

Shows the danger of jumping to conclusions, doesn't it?

Hi Peter,

It's a longshot but you might try Hewlett Packard (What was the Network Measurement / Tech Center Divs.) (707)577-1400 here in Santa Rosa, CA. You'll have to shotgun whoever is working the phones as they won't have a clue as to what a YIG is. I spent 5 years in HP's Microelectronics department building / testing S-band ocs., YTO's (which use YIGs) & 1300 mhz amps. HP use to make YIGS in Tech Center (now called somthing else), & build them in ito YTO's & S-band osc.

Another long shot is a small company started by the one of the guru's of the YIG world (also in Santa Rosa) called MICROSOURCE. (Ganeish Balsnalapotna (spelled the way it sounds) was the inventor of YIGS (so I was told), & was HP's YIG expert but left to start Microsource.) Sorry you'll have to call SR info as I don't have a phone number. They supply HP w/ alot of Microwave Osc. (All mill spec stuff so it isn't cheap.)

Wish I could give more details as to who to talk to, but I haven't been into that stuff since 1983.

Hope this helps.

If you do not use forced air cooling with the 3-500Z, the filament power alone will melt the solder on pins 1 and 5.

>If the CFM airflow is specified,
> how do you measure the airflow in CFM.

A manometer is used to measure the air pressure drop between the under side of the tube socket and the atmosphere. On p.112 of *Care and Feeding of Power Grid Tubes*, Eimac shows you how. On the 3-500Z spec. sheet, Eimac says how many inches of manometer pressure corresponds to CFM when an Eimac air system socket and chimney are used. .

> Blowers are rated at some CFM,
> but I assume that is with no back pressure unlike the situation you
> would find forcing air around a tube. Is it better to measure tube
> envelope temperature directly since that is the parameter of interest.
> ?? Thanks, Dan

At elevated temperatures, the red marking ink that Eimac uses on glass tubes changes from red to brown. Of all the 3-500Zs I have seen that were removed from amplifiers, on average, the 3-500Zs that were removed from Heath SB-220s had the reddest marking ink. Heath does not use air system sockets and chimneys. A detailed discussion of Heath's clever and quiet cooling method can be found in an article on the SB-220 in the November/December 1990 issues of QST magazine.

Since you have found it necessary to post a reply to my (Personal
Email) on a newgroup I will further explain myself Mr Tyler, although
normally I would not , if you just didnt get it the first time.

> Who did he report me to? For what? Language?

Yes for language content mainly, a complaint was sent to
Webmaster@cyberia.com. The complaint on the basis that
foul language was present in messages that are for general perusual.

>this not the internet? Who is policing it? Why? If I was using abusive or
>offensive language over the air on a ham band, I could see his point. BUT,
>THIS IS NOT THE HAM BANDS. THIS IS THE INTERNET.

Tyler i dont see your point here. "If I was using abusive or
offensive language over the air on a ham band, I could see his point."

The audience is significantly larger than any that may accidentally
come across a conversation on a Ham Band, and additionally the header
to your message gave no indication of the sarcastic/foul contents.
Does'nt that only compound your error ?

> He left me no Email address to reply to him to counter his accusation. I am apparently
GUILTY
>until proven otherwise in this US of A!!

How long have you been on the Net ? By virtue of the fact you received
my Email, you have my Personal Email Address. The message was a
personal email not a newgroup posting (A forum I dont consider
suitable for this type of rediculous verbal mongering) I suggest you
check the header information of my original reply.

>
>Mr. Hopps states: "The type of critisism and language contained in your email
>is not fit for public consumption."

>
>This is YOUR opinion Mr. Hopps. Who are you to police what I write? If you
>do not like my use of 4 letter words, a polite email would have done much more
>than this "I tattled on you." email

Again Tyler the original email was personal (Not to a Newsgroup)
and I did consider it polite. As to whether it is "Tattling" or not,
perhaps it is, but I think if we put it into contect. If newspaper,
telephone calls or letters directed to me contained that sort of
content I would certainly take some sort of action to stop it.
I have 2 choices , unsubscribe to the media or do something about
the author. You are aware of my choice.

>. I would like to debate this issue
>further with you. I will not use any abusive language at your previous

As I mentioned in my original email to you, there is nothing to
debate. I have read all postings from you to various newsgroups and I
dont consider that I wish to receive email from you. I have yet to
see a message from you that wasnt sarcastic, or helpful, or better yet
"In the Spirit Of Ham Radio"

>request. However, I would like to discuss the reporting of my email address
>to whoever you reported it to.

I suggest if you think the action unwarranted you send a followup
message to Webmaster@cyberia.com.

I have used a simple circut from an old RS RC transmitter. I made a few small changes to the board to create oscillation, changed the xtal to the channel this jerk would 'puke' on and peaked the output to a full 50 Milliwatts. I put the whole unit with a pair of 9V in parallel into a cigarette hard pack with 108" of magnet wire to work as an antenna and hung it in the guys pine tree about 20 yds from his Antron. He could be heard but he couldn't hear anyone over the osclilator. The bug lasted almost a week-until it rained and soaked thru the cigarette pack.

I've got an old G.E Porta Mobile I've been looking for info on for a long time, still don't have it all but:
The TX uses a crystal multiplied 8 times, (5.590 Mhz = 44.720Mhz) the recieve uses 13.126666 Mhz mixed with 4.805 Mhz to come up with 44.720 Mhz

I know the rx is on 44.720 for sure.

I have tried every combination I know of to figure out the mixing sheme but I can't.
I have isolated the rx portion of the rig and there are only those two crystals on board. I want to put it on 6 FM but just can't figure out mixing scheme between these two rocks.

Additionally anyone with a manual for the G.E Porta Mobile, I will pay for a copy.

From: w8jitom@aol.com
Message-ID: <19970113185100.NAA05046@ladder01.news.aol.com>
Source record: 98544

In article <5bdqc3$7tb@dawn.mmm.com>, grhosler1@mmm.com (Gary Hosler) writes:

>So what's your point Tom? The bottom line is that the MFJ-259 is a
>great tool for use with MOST antennas. As a GDO is has serious
>limitations.

My point, Gary, was to explain the REASON the dip function has a low coefficient of coupling. A statement like this:

>Amen! I didn't realize that the 259 was underpowered.

demonstrates a complete lack of understanding of the problem and the root cause.

>I don't care if the limitation is a lack of battery,
>operating Q, the need for an outboard higher current supply.

I'm sorry. I was only trying to give a factual answer that actually explained the problem, instead of a wild guess or improper conclusion.

>I was simply wondering if anyone else had
>tried to overcome these limitations.

As my explaination of the problem points out, the problem is not correctable by changes in power. If you need a dip device that works with normal sensitivity via coupled fields, you will have to use a real dip meter.

As I consider this further, even if you raised the RF power it would not correct the complaint. Any conclusion "power is too low" is just plain wrong. If you put a dual quad tunnel port 800 cubic inch twin over head camshaft hemi-head 14:1 compression engine driving a generator in it it still wouldn't be any better as a GDO. Although it would make a great jammer.

But even with a penlite cells, the 259 can be used to effectivelyand accurately measure traps. Correct trap tuning involves checking the resonant frequency of the trap as a separate enity, either with a GDO or the 259. The 259 can be directly coupled to the external trap leads.

Never depend on the trap resonance reading with the trap installed in the antenna. That reading will likely be far different than where the trap is really resonant.

455. Super Keyer II Chips Available

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-13 00:00:00 UTC
From: dfroula@oxywhite.interaccess.com
Message-ID: <5bebbt$995@oxywhite.interaccess.com>
Source record: 98545

The Super Keyer II is a deluxe, single-chip microprocesor-based CW keyer based upon the Motorola 68HC705C8 microcontroller. I have twelve pre-programmed microcontrollers with construction details and complete operation manuals, left over from a club group-purchase. Only a crystal and a handful of other common parts are needed to construct a full-featured memory keyer.

Cost of the chip and documentation, post paid, is USD 10.00 to domestic US addresses. Please email me at:

dfroula@interaccess.com

to be sure some are still available, and for ordering instructions.

Note that this is not the newer muliple-chip Superkeyer with the external memory chip.

Features of the keyer include:

- Operational commands sent to keyer in CW with paddles
- Iambic, with dot and dash memories
- Four 48-character memories
- Timed pauses within messages
- Messages may call other messages and contain operational commands
- Message loop capability for continuous play
- Message break-in to allow for paddle-inserted text
- Input queue to store multiple message activation
- Contest serial numbering and control (000-9999)
- Digital and linear analog speed control (6-60 WPM)
- Adjustable weighting (25%-75%)
- 700 HZ sidetone, switchable
- Transmitter key function
- Hand key mode
- Compensation for transmitter key-up delay distortion
- Selectable automatic character spacing
- Keyer-status inquiry functions
- Ultra-power consumption for battery operation
- Many other features

See November 1990 QST for more details.

Most loads will have changing values as a function of their
temperature
coefficient. Most heat sinks, solid or liquid, take time to "respond".
Thus, you may want to consider another approach that is used in
testing
batteries... that is some feedback circuit to compensate for the changing
load. This can be relay controlled or solid state. The relay control
approach switches in ,or out, more or less load to maintain a relatively
constant load. The solid state approach at 300 khz would require more
complex circuitry but would act in the same but more continuous manner.

E-mail me for more info.

True enough. The good news is that the sociopaths who write computer viruses, tend to concentrate on writing viruses for the largest market.

Since Windows is basicly ancient MS-DOS, which is nearing the end of its useful life, and the Mac OS is also nearing the end of its useful life, it will be interesting to see what the operating systems of the future will be. Computers of the future are likely to be able to run any OS, so Dollar Bill's, Intel's, virtual monopoly may be on shaky ground. IBM's upcoming CHRP platform will reportedly run OS-2, Unix, Windows/DOS, Macintosh and BE.

Help!

I have called Yaesu, Kenwood, and Alinco with no luck. I am a tech class licensee and also a vol firefighter. Need to replace my O2 AT that died. Want to have a ham handheld come on when the paging system activates. The manufacturers just want to sell me $800 commercial radios. I would be content even with a simple scanner or pager circuit that I could make/modify as a standalone to come on with the calls. The FD just says to leave their radio on all night, but the static and chatter disturbs family.

You can respond via fax if only couple pages to my work QTH.

FAX (719) 584-4929

Thanks
Bret

467. 2 tone paging (commercial type). Can it be added to a 2M handheld?

Yeah, I recall we went over this in the antenna group last year.

>I'll try to shake some time loose to look up references for current
>distribution or loss in plated materials. As I recall, it's not a simple
>problem. I suspect that both copper oxide and silver sulfide are
>sufficiently highly resistive that neither will contribute appreciable loss
>at HF and above, unless the coating thicknesses are greater than I think
>they'd be.

The skin depth is 1/(sqrt(pi*f*u*uo*a))

Where f is frequency, u is the relative permeability of the material
(1 for all these materials), uo is the premeability of free space,
and a is the conductance of the surface, IE 1/ohms-meter. Here are
the skin depths for the materials in question at a frequency of
100 MHz:

silver 6.37E-6 meter
copper 6.56E-6 meter
silver sulfide 2.25E-3 meter
copper oxide 3.90 meter

It would appear that you are correct. The skin depths for silver sulfide
and copper oxide are both so great that the underlying material will carry

the bulk of the current along the surface of the conductor in either case. This still gives the edge to silver plate, since it will be the underlying material in the sulfide case, but the edge isn't large, about 1.38:1 in favor of the silver plating if it is at least 18 micrometers thick (3 skin depths) below the sulfide coating.

Now contact resistance is a different matter, since the current flow is normal to the surface coating. Silver sulfide is about 6 orders of magnitude less resistive than copper oxide for similar coating thickness. For thin coatings, that may still be insignificant, but it does explain why silver plated contacts are often used.

>I'm not much of a chemist, but it seems that an important issue is whether
>the oxide is porous (as with iron oxide) or non-porous (as with aluminum
>oxide), since a non-porous coating would limit the depth of the coating.
>
>Incidentally, copper sulfide is common in some industrial environments, and
>copper chloride is common near the sea. I know copper chloride is
>non-porous; exposure to salt air will turn wire into powder.

I think you mean that copper chloride is *porous*. It is, and it is also soluable in a weak acid, such as the typical pH of rainwater in many areas downwind of industrial activities. This is what happened to the Statue of Liberty, and why it had to be restored. Acid rain was literally washing it away.

Jumping to an incorrect conclusion is a rare event for you Wes.

I notice Rich used your incorrect assumption as a springboard to attack me and the 1500, once again without having all the facts.

In his case, that seems to be a way of life.

472. Info: FT-101B AM Filter Mods

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-13 00:00:00 UTC
From: Ron.Trepka@chirondiag.com
Message-ID: <32DA654E.3C08@Cibadiag.com>
Source record: 98621

Does anyone have the instructions to modify the Yaesu FT-101B from the CW filter to the AM filter. I have almost all the Fox Tango newsletters from 1974 and 1975 except the one issue that has the article on this mod. The mod is also included when one purchased the filter from the factory. Any info on this would be appreciated.
Thank you.

Ron - WB8QGE - Cleveland, Oh.

Come on now guys. You are reaching conclusions without facts.

Higher power increases battery drain. The bulk of current demand in the
259 is the RF amplifier stage driving the antenna port. At 100 mA of
battery drain is at the limit of what penlitre cells will take.

Going to higher power would require a 120 volt power supply connection, or
a larger battery system like gel cells or lantern batteries.

The 259 has MORE RF output than any other competing analyzer, and couples
fine to any antenna in a normal fashon. The TRUTH is that it is a Q
problem that causes reduced coupling to external resonant circuits via the
grid dip adaptor, not a lack of power.

In a conventional GDO the external coil is part of a resonant circuit in
the oscillator. It has extremely high field levels because of the
operating Q of the oscillating circuit. In ANY antenna analyzer with a dip
adaptor coil, the sense coil is NOT part of an oscillating circuit. ANY
analyzer using this type of dip adaptor will have much less coupling than
a conventional dip meter, and the manual even warns of this.

Get your facts right.

Use a drafting program like AutoCAD (I suppose any paint program would
also work) to make the front panel you want.
Print it on paper with the background color you want. Cover it with
stick-on laminating plastic. Cut out the slots/ holes with an Xacto
knife and glue it on. I usually just print it on plain white
paper and spray it with clear paint after it's installed.

I've also done this with a plotter directly on the metal front panel.
Obviously this only works if you have a flat single-panel facade
and have not yet drilled it.

This will give you much more detail and accuracy than you can get with
any stick-on-letter process.

If you do the panel first, you also have a drill template that's
guaranteed to match the holes in the panel.

miker

PS check the accruacy of your printer/plotter to make sure it's
calibrated
to EXACTLY 1:1. Very tiny errors can make it not fit.

I bought a device like this, made for the U.S. Army, which does exactly what is described in Bret's posting. The device has a seismic probe that you stick in the ground. You set the sensitivity of the seismic probe with a switch. You unfold the metal tape antenna and install 2 9V batteries. The device emits a series of audible beeps on a VHF frequency (I forget the exact one) when the device is activated. Several of these devices came in a set, each device used a different series of coded beeps. Each device is in a very attractive olive drab, water-tight case. At Dayton several years ago, I belive I paid around $10.

The device is called a "personnel seismic intrusion device." I don't remember the AN/... military part number. I believe that they are available from Fair Radio sales. I occasionally see them at hamfests.

>
> N7WS

According to what I have heard about the AL-1500, it shows the danger of jumping to the conculsion that the 8877 does not need a VHF parasitic-oscillation suppressor. .

This morning, I removed the anode-cooler from one of the three kaput 8877s I received from Lon, K5JV. Before anode-cooler removal, this particular 8877 exhibited a relatively minor amount of loose gold, acoording to the degree of positive leakage current in the Funderburg test.

I can see four places on the 8877's grid where the gold has melted and pooled into large melt balls, and other places on the grid where smaller melt-balls formed. One of the four larger melt-balls has apparently blistered and lost some of its gold. All of the gold melt-balls that were stuck to the grid were toward the grounded end of the grid. The other end of the grid (beyond the mid-point horizonal support wire) exhibited no

evidence of gold having melted. IMO, the relative position of the gold melt-balls is not consistent with the distribution of HF grid current. To me, UHF current seems to be more likely to produce such a result.

Now that we have Wes Stewart's VHF suppressor measurements, why has Mr. Rauch apparently lost interest in the matter? Hmmmmmmm.

With the correct amplifiers and electrode application, you certainly can get EEG signals.

Typically they will be on the order of a few millivolts 3-5 mV is normal. Frequency depends on brain activity and whether the subject is asleep or awake. Typically you can expect to see 5-25 Hz waves and components.

If you need more detail, I would recommend getting a book on the subject. I am just responding because I didn't see any repplies to your article, and I work with sleep study equipment that looks at EEG among other parameters.

>would
>be gratly appreciated, thanks in advance

Sounds like the filter capacitors in the supply have gone south.
Or you're getting RF back into the power supply regulator.
Either one would give this symptom. If the filters have dried up,
you get more hum when you put more load on the supply, IE when
transmitting. And if it is RF getting into the regulator, then
obviously it only happens on transmit. RF feedback into a supply
can sound a lot like AC hum. It is often difficult to tell which
is which by ear.

If you know someone with a scope, he can check the supply for
hum due to faulty filter capacitors. Just put a load on the
supply and scope the output. Or you can try putting a fairly
large filter capacitor in parallel with the existing capacitors
and see if that solves the problem.

If it is RF, putting a 0.001 uf disc ceramic across the output
terminals of the supply may solve the problem, and/or wrapping
the AC cord on a ferrite rod or one of those Radio Shack snap
together toroids may do the job depending on how the RF is
getting into the supply.

If you're using the rubber ducky antenna, try using an external
antenna. That'll get the RF away from the supply and will probably
cure the problem if it is RF feedback. I've seen this cure a number
of odd problems with power supplies.

If you have access to a laser or inkjet printer, consider making
a transparent "cover" for the front pannel by printing on an
overhead transparency, and putting this over your pannel.

If you use a color printer, the effects could be really nice.

497. 10/11m homebrew TX ATU ???

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-14 00:00:00 UTC
From: Bowes@CEU
Message-ID: <Bowes.27.000A4FFE@CEU>
Source record: 98550

Dear all,

Just like to ask if anyone has built a 10/11m TX ATU ??? I'm thinking about putting one together but only have some basic plans with scratchy details. If someone has done this with success could they please contact with any hints, tips, details, of parts etc etc. I am finding particularly difficult to find out what variable capacitors I would need to cover 10 & 11m bands. I have a bunch of V. capacitors at home but they have no details of rating. Also is it possible to use capacitors salvaged from old radios for TX ops or do the vanes need to be wideley spaced ??? If you can see the kind of small dilemmas I have here and you think that you could help me then it would be greatly appreciated.

Thanks alot

Jonathan

I would like to interface a DTMF decoder chip, M8870, to my LPT1. Has anyone done this and have info or ideas? I am decoding large tone sequnces and need to capture about 1000 40ms tones. I figure the best way is to connect ouput of chip to parallel port and read into Qbasic or equiv. Any help is greatly appreciated.

John:

Dentron Radio Co. used to buy capacitors from All Star Products in Edgerton, OH.
The company is now called Oren Elliot Products and last time I checked they were still making variable caps. They also made a ton for Heath in their hayday.

Additionally, (a bit of radio history) Dentron Radio was moved to Edgerton, OH around 1983. They were chapter 11 but allowed to operate while under the direction of Oren Elliot. They closed the doors about 1 yr. later. There is a new amp/tuner company currently advertising from Bryan, OH. Since Bryan is only 15 min. down the road I wonder if they may have bought some of the remaining stock?

Good Luck, Tim, ka8ddz

Call Great Lakes Electronics in Battle Creek, MI 616-963-6282
They are a distributor and I know they have a line of ceramic
(EXPENSIVE) type wafer switches.

Yes: I cannot recall the URL for downloading, but the file name of a DOS
Spec Anal is freq51.zip. A great WIN95 file is called COOL96.zip. The
latter is a multifile download with instructions for proper install. I
found them doing searches on SOUND CARD SPECTRUM ANALYSIS or something
very similar!! The files are large, but I have your e-mail and will
attempt emailing them direct to you!

Try printer's film from an imagesetter. Your local print shop
might help you there. Just print to a PostScript-file and take
this file to the print shop. The resulting film is strong and
protects the lettering/graphics/symbols from scratches.

You can also use this film for making PCBs.

Hope that helps,

By all means. Please.

>
>[snip]
>
>>Gary
>
>N7WS

In the days when I was on 2m EME and constantly building/testing/using
low-noise preamplifiers, I had access to a good lab and could do those
"0.01 dB" noise figure measurements. For whatever they were worth.

It used to bother me that the real system was probably never anything
like the source impedance presented by the NF measurement setup, and I
always wondered whether optimizing the NF on a lab setup was really the
way to go.

I had thought about bringing a SINAD meter home sometime, setting up a
distant weak-signal source that would give me 6 or 8 dB SINAD at the

receiver audio output (SSB, tuned for 1 kHz tone or so to find the notch in the SINAD meter) and then going to work adjusting the LNA and maybe transverter front end for the best SINAD. It seemed to me that this technique would always ensure the best possible noise figure for the system, regardless of whether I knew an exact value for it.

Alas, I never got a "round tuit" and now it seems that I never will.

Has anyone else thought of or tried this technique? I never saw it written up anywhere...

It always seemed to me that this would be the way to ensure that the system was adjusted for the best possible NF, regardless of whatever the LNA measured at the latest NF party. Bring it to the party, test it, adjust it, laugh or cry over the results - but then, bring it home and use a SINAD meter to retune it in the actual system to its best performance.

Comments?

From: tonyz@rose.hp.com
Message-ID: <5bh5ul$p2j@rosenews.rose.hp.com>
Source record: 98564

Hi, I came across an old Graymark AM/shortwave kit from
the 60's, I think. Uses 7 and 9 pin miniatures, and it does
not have any model number on it anywhere.

I have the AM plug-in coil, but this regenerative
receiver has the capability of rcv'ng shortwave
with the proper coils.

Does anyone have any instructions/manual for something
like this that might tell me how to wind coils for
shortwave?

I have been messing around with winding my own coils,
using standard coil-winding info from several references
but have not had much luck, the last coil I wound got
me around the 160 meter wavelength in the middle of
the dial and each coil takes a while to wind.

This kit must have been pretty common and was probably
standard high-school project material.

Any info would be appreciated.

Thanks. Tony

Getting all the facts from Mr. Tom Rauch would try the patience of Job. .

Tom:
Does the AL-1500 currently use a vhf parasitic suppressor? If not, are
you going to add a vhf parasitic suppressor?
Are all of the reported 8877 failures in AL-1500s Eimac's fault?
Who is Eimac's Mr. XXX?
Are you tiptoeing around Wes' suppressor measurements?
Can you explain the gold melt pattern I observed on the grid of the kaput
8877 I recently opened?
Where is Mr. Miklos?

BTW, Tom, one of the phone numbers for Harris Alloys, Inc. is 201 483
0092. According to Wes' measurements, the nichrome-60 alloy offers a
slight advantage over the 80/20 'pure' nichrome alloy. #20 gauge should
be about right for 3-500Zs. The 95/5 alloy 430 deg. F silver solder and
stainless steel soldering flux are available at welding supply stores.

It's a fairly common technique to dangle a dipole somwewhere inside the
array/dish and feed it from the ordinary noise source through a wideband
amplifier (a few milliwatts seems to be enough). Then you can use a NF
test set to maximize the S/N. Readings will only be relative but it will
be a true maximum.

It is very important is that the impedance of the noise source does not
change between the on/off states while you're actually optimizing the
preamp, because that will give you a false optimum. The reason is that
the gain of the preamp is very sensitive to the impedance connected to
its input. Note that it's the gain change that causes the error in the

NF displayed by the meter - the true NF actually changes very little.

This topic of sensitivity to input impedance was discussed at some length a few years ago in DUBUS. DJ9BV proved fairly conclusively that it isn't a large effect. Even for high-input-reflection GaAsFET preamps like we use on 144 and 432, and antenna VSWR of about 1.5 is only likely to add less than 0.1dB to the NF.

In other words, you can set up the preamp in the lab, and see very little change in NF when it's installed on a real antenna. I'm likely to make bigger errors by trying to optimize the NF from the top of a ladder!

The outcome of the DUBUS-inspired debate was that if there really is a big change in performance with input impedance, it's more likely to be due to oscillation breaking out in the GHz region. Personally I'd rather have an unconditionally stable preamp I can rely on, than a flaky one with 0.1dB better NF.

You can also buy a spray bottle that has a CO2 cartridge that you add paint too. That way you don't need an air brush or spray paint compresser rig. You can find these where they sell automotive paint. Some automotive paint store's will match your color and put it in a spray can for you.

ROFL, L, L. Very good, Bill. This is precisely where Mr. Gates is
headed. His strategy appears to be
[1] build a big market share.
[2] steal your competition's best ideas,
[3] run them out of business.
[4] reach way, down deep into everyone's pockets.

Does Gates support the idea of a free market place?
"If two people provide equivalent software, its value
is zero." -----Bill Gates

"There are people who don't like capitalism, and there are
people who don't like PCs, but there's no one who likes the PC
who doesn't like Microsoft." -----Bill Gates

OTOH, people who dislike monopolies, don't seem to like Microsoft.

520. Follow-up on CB-to-10M ssb conversion

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-14 00:00:00 UTC
From: gene@eagle.csl.uiuc.edu
Message-ID: <gene.853278994@eagle.csl.uiuc.edu>
Source record: 98573

About a year ago I posted some rather detailed instructions and concepts for modifying CB-SSB transceivers for use in the 28.300-28.500 MHz Novice band. (I still have the old files and could e-mail them to anyone interested).
I did not investigate, but one reply also suggested that LOU@CBCINTL.COM sells a book with conversion information.
I took the model I converted (Midland Model 79-892) camping last summer and managed a couple of QSO's on a mobile whip, although conditions were not great.
I had converted it so that the XMIT changed in 5 KHz steps (except a few places jumped 10 KHz due to the unique allotment in the original CB-channels).
BUT with such a weak signal, I found that being able to shift frequency either side of the 5 KHz steps was necessary, so as to get exactly on the frequency of the station being heard. I therefore further modified the trans-ceiver so that the so-called "clarifier" that several models use on "receive only" was connected so as to change BOTH Xmit & Rcv identically. This turned out to be quite simple, at least on my unit. Of course with a little more complication, one could add an additional pot and switch so as to zero a station, while Xmit & Rcv are identical, then throw a toggle-switch to provide RIT (Receive-Incremental-Tune) on receive-only but Iconsidered this over-kill for such a low-power transceiver unit.
I did this by cutting the control-voltage wire to the Xmit-diode/resistor (D-5, R-25 on my model). I transferred the control-voltage wire to the Rcv-diode/resistor (D-4, R-24) to a constant +9v (regulated). This was about 1 volt higher than the original control-voltage, and gave me a little more frequency-deviation, which is accomplished by "pulling" an Xtal-oscillator, (i.e. VXO) which of course has limits. The result, was a frequency shift of 3.5 KHz (+ or - 1.75 KHz). Of course it would have been nice to have a shift of + or - 2.5 KHz, which would fill in the gap completely between the basic 5 KHz steps (on most channels), but I considered it fortunate to get this much shift so simply, and with no complications with the Xtal oscillator.
The above-mentioned diodes (only a single diode D-4 after my modification) provide dc-bias to the varicap (D-3) whose capacitance is included in the Xtal-oscillator's circuit.
With the 10-meter band beginning its slow rise to improving conditions this year, perhaps 5 or 10 watts will enjoy success even without a linear amplifier.
With the FCC's new concern about radiation and power levels, there will certainly be no concern with this power-level!

I should point out that when the 5 KHz option (on the PLL-02A synthesizer) is chosen, you can't quite reach the top of the Novice-band....the highest on the Chan-40 position is 28.462 MHz with the variable pot at maximum.
Also, to remain safe you should use Chan-12 as the lower-limit (28,308.5 with the variable pot at min). Although it might be risky, on Chan-11 you can tune down thru 28,300, to 28,298.5 which of course is illegal.

This is caused from inadequate filtering from AC to DC. The more
current the radio draws, the worse the hum will be. This can usually be
quited down by placing a large electrolytic capacitor across the output
(make sure it doesn't pull too much current when the supply is first
turned on). Another idea that might work is the automotive power-line
filters that they sale at radio shack. One lead goes to ground, one
from the power supply, and one to the rig.

Get an old style mechanical door buzzer, the kind with a coil and
mechanical clapper. Attach two 108" dipoles to it, one on each side of
the buzzer contact switch. string them out vertically or horizontally to
match the intended targets antenna polarity. Apply a large 6 volt
lantern battery. Bye Bye CB band. If that isn't high tech enuff let me
know.

525. VLF ferrite rod antenna questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-14 00:00:00 UTC
From: Scott Coburn <scott@bnl.gov>
Message-ID: <32DBC9E0.63DECDAD@bnl.gov>
Source record: 98578
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

I have built a WWVB (60kHz) VLF radio receiver. It is the receiver designed by Bob Roehrig and described in the article "Most Accurate Frequency Standard, Parts 1,2,3", 73, Jan/Feb/Mar 1994. It is a Tuned Radio Frequency (TRF) receiver with an active ferrite rod antenna.

I constructed the ferrite rod antenna/preamplifier as described in the article and the receiver powers up OK and gets through all of the alignment procedures outlined in the article. I have not yet gotten the WWVB signal, but I suspect that is more a misfortune of my location than a receiver problem.

Anyway, I have a few questions:

* I have wound my antenna on a length of 'generic' ferrite rod which is 3/8" in diameter and about 7" long. I put 700 turns of 34 AWG formvar coated wire on it. This covered about 5 of the 7 inches of the rod's length. The article says to use an 820pf fixed capacitor and a 10-180pf variable capacitor in parallel with the antenna, and to tune the variable capacitor to resonate the whole business at 60kHz. Ignoring stray capacitance and setting the variable to 100pf (about mid-range) the inductance of the antenna should be about 8 mH. I measured my antenna and found it to be about 26 mH. I connected it into the circuit and found that I could get it to resonate at 60kHz by using a 330pf fixed capacitor (rather than the 820pF called for). So, the question is: is there a 'prefered' range of values for the L/C values in a tuned circuit like this? Will the circuit get strange if the capacitance is too low (temperature
or stray variation effects?)? Should I un-wind some of my antenna and go to a larger capacitance? Is it 'better' to have more loops in the antenna at the expense of needing a smaller capacitor?

* I have placed the antenna into an 'electrostatic shield' as described in R W Burhans' article "Loop Antennas", Radio Electronics, June 1983.
I constructed the shield from a 10" length of 2" diameter heavy-wall aluminum tubing. I machined a slit through the wall the full length of the tubing. I positioned the antenna rod in the center of the tubing
using a couple pieces of plexi-glass type material. The tube is screwed
to the aluminum box which contains the preamplifier board and this is grounded through the BNC cable to the receiver. Does this sound like a 'good thing'? Should I have done it differently?

* My house is 'surrounded' on the west and south sides by very tall pine trees
(about twice the height of the house). I would like to be able to run the
antenna in the peak of my roof (in the attic) so that I don't have to worry
about weather-proofing it. Are these trees going to cause me problems?
Is my view of Boulder CO blocked by this 'ground plane' of trees? (Where's
my chain saw...) Should I put the antenna into a PVC tube and put it up in
one of these trees? Should I move to Boulder?

* How could I construct a small 'transmitting' antenna that I can connect
to my signal generator so that I can generate approximately what I
expect the WWVB signal level to be at my location? From WWVB signal
intensity profiles that I have seen it looks like the signal should be
somewhat less than 100uV/m. I don't have access to much in the way of
fancy equipment so it would be nice if I could 'calculate' a transmitter
antenna and input signal level to give me the right transmitted signal
level. Is this possible? I could wrap some wire around the aluminum
tube to generate a signal. Do I need some other load (ie a resistor
in series with the wire)? How many turns and what signal level should
I put into it?

I'm sure I'll think of some more questions after posting this. Any help
would be welcome.

Thanks,

Scott

117L7GT/117M7GT are Rectifier-Beam Power Tubes

Half-Wave rectifier and usually Class A Amplifier

Pin Number Internal Connection

1 Cathode of Diode
2 Heater (117V @ .09A)
3 Plate of Beam Pentode
4 Grid 1
5 Grid 2
6 Plate of Diode
7 Heater
8 Cathode and Grid 3

I don't know of a direct substitution, but you could improvise from the above data. These tubes were used in cheap phonograph players in the '50s.

>mixing scheme between these two rocks.

Tim if I remember right, the formula for the receiver is more
complicated than for the transmitter because you don't know the
frequency of the last IF. There won't necessarily be a crystal
in the rig to indicate such a frequency because the final
conversion stage uses tuned circuitry rather than a crystal to
convert the receive signal to audio.

The first crystal cries out to be multiplied by three. From this,
and playing with my calculator I would guess that both
crystals are tripled. The first conversion could beat the 39.38
against the incoming 44.72 yeilding a 5.34 MHz difference frequency
which would be injected with the 14.415 yielding a 9.075 MHz
difference which is detected. You may be able to listen for these
frequencies by removing the tube shields and wrapping a wire around
a tube, listen on a scanner or other wide-coverage receiver. Once
you think you've found the last IF, use a signal generator or other
transmitting equipment to put a signal on the air (use a dummy load
located nearby the rig so you don't bother anyone) to test your
theory.

I'm not sure my guess is correct as to the multiplication scheme, it
could be any of a number of different combinations but surely all
those sixes indicates a multiple of three for the multiplier on
that one, and I would bet against any sum or difference where two of
the numbers in the equation are close together, like
3 * 13.126666 = 39.38
44.72 - 39.38 = 5.34
2 * 4.805 = 9.61
9.61 - 5.34 = 4.27
just because it's so important in mixers to keep the original

components out of the output signal. It is much easier to prevent 5.34 and 14.415 components out of a mixer designed to output 9 MHz than it is to keep a 5.34 MHz component from appearing in a 4.27 MHz output.

Let us know what your further investigation turns up.

531. NF versus input impedance question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-15 00:00:00 UTC
From: tomb@lsid.hp.com
Message-ID: <5bjas1$nt7@hpcvsnz.cv.hp.com>
Source record: 98398

There has been a bit of discussion about how an amplifier adjusted for minimum noise figure for a given source impedance does not, in general, offer a load impedance equal to the (complex conjugate of the) source impedance.

I have an application in which I'd like to have an optimized noise figure, but specifically would like a very high load impedance, and I'm wondering if anyone has suggestions about specific components or circuits to achieve this. This is for the 2 meter band, at the moment, but I'd like to be able to extend it well above that and somewhat below as well, if it works out for me.

The source impedance is approximately 50 ohms in this case, and if I could get to over 1000 ohms load impedance, it would be nice.

>>Extracted from E-mail>>
The suppressor graphs (RL.GIF) seem to show two things:

1. The conventional (non-nichrome) suppressor gives a faster roll-off of Q with frequency than the nichrome suppressors.

2. There's very little difference between the two grades of nichrome.

You obviously don't want to get publicly embroiled in this controversy, and neither do I. However, it does seem that the distinguishing feature of the nichrome suppressors is their low HF Q. The VHF Qs are all pretty similar.

The VHF Q of the conventional suppressor could be made exactly the same as the nichrome ones by changing the value of either L or R, but the HF Q of the conventional suppressor would still be about a factor 2 higher.<<-<<

I don't blame anyone for avoiding Rich's wrath. But since I am already on his top ten list, I have nothing much to lose, hi. So I'll post this and accept the return attack it will almost certainly generate.

This conclusion above is the same conclusion I reached, nichrome suppressors offer lower HF Q, and nearly identical VHF performance. Just the slightest adjustment in resistance or inductance of the conventional copper wire suppressor would result in less VHF Q without greatly changing HF Q.

If the data is reviewed, the ratio of Q is almost unity at 200 MHz and over 2:1 at 10 MHz. Just the slightest adjustment of R or L will make the conventional suppressor equal the nichrome at VHF, while maintaining better Q at HF where we want losses to be reduced.

For example, the AL-80B oscillates at about 170-180 MHz when the suppressor is removed. At that frequency, Wes measured a Q of about one (same as I posted weeks ago). The Q of a duplicate nichrome suppressor is about .75. This very small Q change is diluted by circuit effects when the suppressor is installed in an actual PA. The actual operating Q change would be even less at VHF, and more at HF.

Rich's claim this small change in VHF Q is a great or worthwhile improvement that cures all woes is completely false. Anyone believing that would have to have a real problem understanding parallel and series L/R circuits. Add one turn to the conventional suppressor or adjust the resistor size, and you've gone even lower with Q than the nichrome.

Finally, I'd like to remind everyone how (over and over again) Measures squaked about how he could SEE the difference in his dip meter, describing all the sharp dips that went away when he made (what amounts to) a *very* small Q reduction at the frequency of interest. Rich would have use believe he measured a Q change of less than 0.5 with his GDO!

Remember and compare those claims of what he "saw first hand" to other claims of things he "knew for a fact":

1.) The Miklos employment tale. He claimed he "called Eimac" and they told him Buzz was never R+D manager. Yet Eimac even issued a letter (after getting Buzz's permission) explaining Buzz was indeed R+D manager. Not only that, VHF Handbooks list Buzz as Eimac's former R+D Manager. Even after the employment confirming letter was out, Rich sent Buzz Miklos a post card telling Buzz he was never R+D manager!

2.) The tale about Marvin Born. Rich said Marvin measured parasitics in an AL1500. Turns out it wasn't even an AL1500, it was a dual 8877 PA built on a old empty prototype chassis. When I talked to Marvin he said he was positive Rich knew he was talking about a west coast manufactured 3CX3000 PA, and not a AL-1500.

3.) Rich's tale about 500 watt 8877 grids. Eimacs own catalog disagrees and they even have an application note describing how improper tuning can destroy the grid.

4.) Rich's story about a photon hitting the cathode of a tube ON STANDBY and blowing up a PA. A physicist who works with that type of stuff every day said it was bunk.

5.) The story about the variac and filament meter markings **on every broadcast transmitter** and Rich's slam of every amateur manufacturer for doing something the commercial manufacturers apparently don't often do. Several people jumped in and proved he was telling another story.

6.) Measures' claim a certain TL-922 was damaged by a parasitic. The owner showed up and said "no, it was a lightning arrestor causing the arc, I removed it and the amp is fine".

7.) Measures' attempt to blame me for Wes' unintentional error. Rich was completely aware of how this happened BEFORE he posted his pathological accusation that I was trying to hide something, and that I misled Wes.

When all this is considered it becomes perfectly clear Measures presents untrue statements as fact, even when he should have known in advance what he says really isn't true.

We all make occasional mistakes, but this stuff goes far beyond once in a while. It appears to be chronic or habitual.

The VHF Q of the conventional suppressor could be made exactly the same as the nichrome ones by changing the value of either L or R, but the HF Q of the conventional suppressor would still be about a factor 2 higher.<<-<<

I don't blame anyone for avoiding Rich's wrath. But since I am already on his top ten list, I have nothing much to lose, hi. So I'll post this and accept the return attack it will almost certainly generate.

This conclusion above is the same conclusion I reached, nichrome suppressors offer lower HF Q, and nearly identical VHF performance. Just the slightest adjustment in resistance or inductance of the conventional copper wire suppressor would result in less VHF Q without greatly changing HF Q.

If the data is reviewed, the ratio of Q is almost unity at 200 MHz and over 2:1 at 10 MHz. Just the slightest adjustment of R or L will make the conventional suppressor equal the nichrome at VHF, while maintaining better Q at HF where we want losses to be reduced.

For example, the AL-80B oscillates at about 170-180 MHz when the suppressor is removed. At that frequency, Wes measured a Q of about one (same as I posted weeks ago). The Q of a duplicate nichrome suppressor is about .75. This very small Q change is diluted by circuit effects when the suppressor is installed in an actual PA. The actual operating Q change would be even less at VHF, and more at HF.

Rich's claim this small change in VHF Q is a great or worthwhile improvement that cures all woes is completely false. Anyone believing that would have to have a real problem understanding parallel and series L/R circuits. Add one turn to the conventional suppressor or adjust the resistor size, and you've gone even lower with Q than the nichrome.

Finally, I'd like to remind everyone how (over and over again) Measures squaked about how he could SEE the difference in his dip meter, describing all the sharp dips that went away when he made (what amounts to) a *very* small Q reduction at the frequency of interest. Rich would have use believe he measured a Q change of less than 0.5 with his GDO!

Remember and compare those claims of what he "saw first hand" to other claims of things he "knew for a fact":

1.) The Miklos employment tale. He claimed he "called Eimac" and they told him Buzz was never R+D manager. Yet Eimac even issued a letter (after getting Buzz's permission) explaining Buzz was indeed R+D manager. Not only that, VHF Handbooks list Buzz as Eimac's former R+D Manager. Even after the employment confirming letter was out, Rich sent Buzz Miklos a post card telling Buzz he was never R+D manager!

2.) The tale about Marvin Born. Rich said Marvin measured parasitics in an AL1500. Turns out it wasn't even an AL1500, it was a dual 8877 PA built on a old empty prototype chassis. When I talked to Marvin he said he was positive Rich knew he was talking about a west coast manufactured 3CX3000 PA, and not a AL-1500.

3.) Rich's tale about 500 watt 8877 grids. Eimacs own catalog disagrees and they even have an application note describing how improper tuning can destroy the grid.

4.) Rich's story about a photon hitting the cathode of a tube ON STANDBY and blowing up a PA. A physicist who works with that type of stuff every day said it was bunk.

5.) The story about the variac and filament meter markings **on every broadcast transmitter** and Rich's slam of every amateur manufacturer for doing something the commercial manufacturers apparently don't often do. Several people jumped in and proved he was telling another story.

6.) Measures' claim a certain TL-922 was damaged by a parasitic. The owner showed up and said "no, it was a lightning arrestor causing the arc, I removed it and the amp is fine".

7.) Measures' attempt to blame me for Wes' unintentional error. Rich was completely aware of how this happened BEFORE he posted his pathological accusation that I was trying to hide something, and that I misled Wes.

When all this is considered it becomes perfectly clear Measures presents untrue statements as fact, even when he should have known in advance what he says really isn't true.

We all make occasional mistakes, but this stuff goes far beyond once in a while. It appears to be chronic or habitual.

My mla2500 roadmap says these 5 caps have a rating of 500v. I don't know of any source of 500v electrolytics. From my own experience, 500v is really pushing the envelope for an aluminum electrolytic cap.---i.e., they don't seem to last as long as lower v rated electrolytics. I would be tempted to go to 7 400v units or to 6 450v units, using more C per unit. One source of Panasonic/Matsushita filter caps is DigiKey 1 800 344 4539. 150uF is not really enough C. I would use the largest amount of C that will fit comfortably. The Panasonic/Matsushita filter caps are of a new compact design that packs in more C per cubic inch, so you should be able to get more C and have room for the extra one or two capacitors. The new cap. arrangement can be mounted on a 1/8"-t acrylic sheet rectangle---covering the original cap. mtg. arrangement. Electrolytic caps can be easily mounted on the acrylic, sheet upside down with silicone rubber adhesive/sealant. Allow a mm or two between caps for air circulation. The equalizer resistors can go directly across the capacitor terminals. Since heat rises, that way the caps. don't get roasted by the equalizer resistors. Also, the carbon-comp. equalizer resistors Dentron (Dennis Haad) used are not stable. They should be replaced with Matsushita 100k ohm 3w mof resistors, which are also sold by DigiKey.

You have not said what the current drain of your HT is. It sounds
like you are pulling more out of the supply than it is rated for. The
regulator(I assume it is regulated) goes into saturation and closely
couples the output to the input and its relatively high ripple content.
The regulator will attenuate the ripple as long it is in its linear
region. When saturated, it can not regulate out the ripple.

Hello Bret

You did not advise what type of radio you have or if it has a speaker jack.
There are several ways to do what you wish but the simplest way is to buy a 2 tone decoder from Communications Specialists and build a small circuit to listen for the tones sent out by the dispatch center and use them to turn on a speaker.
To use you would need to know the two tone frequencys sent out to alert the radio and obtain a decoder programed for them. Comm Spec can be reached at 1-800-854-0547. The have a programable unit they sell for about 60.00 the model number is SD-1000. The have circuit plans with every decoder.

I hope this helps and I understand what you do as I am a Police/Fire E991 Dispatcher.

Have fun

I have a GLEN custom 1600 for sale. It uses 4--4CX250R ceramic tubes. It
is
in PERFECT shape in all meanings of the word! If you havent heard of this
amp, I'll tell a little bit about it. The band-width on this unit is 40-2
meters.(about 7MHz through 145 MHz) It will take an input of about 4
watts-100 watts,(adjustable on rear of unit). It has an input on back for
direct key-up(re. footpedal). It runs on 120v ac. it has variable output(
kinda like the texas star 350 w/ variable). It has a built in watt meter,
that reads RMS, and is very accurate. The output is 1700 watts rms, 2700
watts peak, depending on how you drive it. This amp is beeing offered to
the
serious only. Not a scratch on it, no discolorings, no blemishes. very
PERFECT condition. Comes with origional paper work, schematics, and custom
slip/dust cover. Weighs about 90 pounds. 1800.00 + shipping, please dont
respond unless your serious,,, 73's, and happy modulating,, STRESS TEST.

You forgot the the crystal mixing will never equal the
receiver frequency. The LO injection will be at the
sum or difference of the IF frequency. You must know
the first IF frequency to figure out the relationship.

Message-ID: <32dc9e0d.3352841@news.lin.foa.se>
Source record: 98587

Looking at the numbers I beleive that 13.12666 is multiplied 3 times!
Should give 39.38 MHz. Using this as first LO gives an IF of 5.34 MHz,
odd but not impossible! Second LO 4.805 gives second IF of 535 kHz,
sound almost likely. Check any markings of filters to find out the
centre- frequecy of any IF.

Good Luck

Hopefully someone will be able to direct you to a reference. If not, you might look into some books dealing with semiconductor processing. Apparently, popcorn noise is due to poor processing, so isn't covered in most of the conventional textbooks. I know I've found references to it in the past (having first been burned by this phenomenon over 20 years ago, which I still remember), but I can't find any references in the several texts I now have.

In my experience, popcorn noise is characterized by abrupt jumps to a second DC level and back a few times per second. With amplification, it sounds a lot like corn popping, hence the name.

Good luck!

Monty:
I built a screen grid modulated TX way back in 1951. (Actually these designs were very popular then for people who could not afford a big class B Audio amplifier for plate modulation).
The transmitter worked very well, I needed only very low audio power to modulate a 813 with approx. 100 watts RF power output. Obviously the disadvantage was that I could not get more RF out of the PA.
Apart from that audio quality was quite good.

The explanation that I remember is that poor processing left
ionic contamination on the surface of the semiconductor and that
these ions broke loose due to temperature, vibration, and votage stress,
thereby delivering a charge pulse that was amplified and eventually
disapated.

I would like to find a CW filter for my TEN-TEC Corsair.

First choice of 500hz filter then the 250hz in a pinch.

Thanks,

Jack kovar

I just had the pleasure of checking this out also. Yes, it does still
work, and works great. Fantastic amount of info on the old gear.

P.S.
I remember when the OLD gear was considered NEW gear.

My compliments to the person responcible for the web site.

Regards
Reed

567. Re: topconnector, how to make these ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-16 00:00:00 UTC
From: Jim <jstrohm@texas.net>
Message-ID: <5blmi4$8l6@newsgate.sps.mot.com>
Source record: 98420

Wrap a strip of brass or copper (1 cm wide is good) around a
drill bit that is smaller than the 807 top terminal, and
clamp in a vise. Drill a hole in the tabs and put in a small bolt.
This will clamp on the top terminal properly.

If you have an old fuse holder that takes a fuse the same diameter
as the top terminal, you can remove the fuse holding clip and use
this.

A small stainless steel automotive hose clamp will also work.

>that. With some constructive criticism, future CDs will be better.

The real issue here is that the old QSTs in the compilation weren't in computer readable form, and had to be scanned as page images. OCR is imperfect, and the amount of copy editing required to convert those images into a common text format was too much to make the product economically viable.

Page images are Ok as long as the image format is standard and platform independent. We can still display the images on various flavors of machinery and OS, but the tools we need to do it are different for each platform. If someone wants to do something useful, they'll gather the required tools for each platform and make them available on the ARRL Website.

Of course we can't do exhaustive searches of page images the way we can with a standard machine readable text format. So if someone really wants to be useful, they'll take the compilation disks and convert them, via OCR and copy editing, to a standard text format. This will have to be a labor of love because there's no way the market would support the cost of doing this commercially.

For *future* QST CDROM volumes, compilied from current year magazines, the ARRL should use a standard platform independent text and image format. That's viable because the originals will already be in computer readable form, because that's the way they are produced now, and translating them to any other standard form is a simple machine process. That wasn't the case with old QSTs in the archive release.

PDF is Ok, but I really like HTML because it is a natural for *any* browser on *any* platform. And it would allow embedding links from the contents page to the articles, and to later bugfix notices about the article. Everyone feels at home with a browser, so this makes the system very user friendly. We can still do exhaustive searches of HTML text with common tools such as grep, though it looks nasty unless we can couple the hits back into the browser gracefully.

OTOH, PDF preserves the *look* of the original magazines. There may be an esthetic reason to preserve this, though I'd personally prefer to be able to customize displayed fonts, line lengths, etc, to something I can easily read on whatever screen I happen to have. That's a drawback with PDF. And I don't really need to see old advertising intruding on article text. (The advertising should be kept, however, for historical reference, but I'd be happy to see that retained as image files of each bit of ad copy.)

Jim:
Check out the local swap meets and Hamfests for some old
MDS receiver dishes. These were used quite widely a few years
back and are cut quite closely to 2.4g. The feed horns and the antennas
will work, but just throw the rest away.

>Cheers,
>Tom
>tomb@lsid.hp.com

First of all, you can derive from the equations in Motchenbacher and Fichen the fact that a grounded emitter transistor optimized for best NF at 50 ohms source impedance results in the input impedance being 50*sqrt(beta). But you'd have to have a beta of 400 to get to 1000 ohms. So you end up with a few hundred ohms input impedance.

Go ahead and optimize your amplifier for best NF, then measure its input impedance. Now feedback a portion of the output to the emitter in the right phase to raise the input impedance of the amplifier to 1000 ohms. You can adjust the feedback to get exactly 1000 ohms, or try for more than 1000 ohms (it is not clear if more is better in your application). As long as the feedback is lossless (i.e. transformer coupled, or done with a direction coupler, etc.) you should not significantly degrade the NF of the amplifier by adding the feedback.

An article describing this technique appeared in the last year or two, but I can't remember where I saw it. In the article, the author used feedback to lower the input impedance to 50 ohms, but I don't see why it wouldn't work the other way too.

574. Re: How's it mixed? Two crystals

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-16 00:00:00 UTC
From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <32DE5D21.4065@lanl.gov>
Source record: 98427

The easiest way to accomplish this is to forget the calculations and let
the crystal supplier do it for you. All major xtal suppliers have the
formulas for the most popular commercial and most amateur gear and all
you have to do is tell them YOUR desired tx and rx frequency as well as
the model number of the radio you want it for.
You didn't specify (maybe you don't know) the IF frequency, but a
perhaps mixing formula could be:
13.12666 xtal freq. multiplied to 39.37998
(round it off to 39.38
Mixed with 4.805 LO gives 44.185
Producing a possible IF of .535 MHZ
Which adds up to 44.720 MHZ

Or, if hi-side injection is used: 44.720 Desired Freq
Plus LO 4.805
Equals 49.525
Minus Xtal tripled freq. 39.38
Equals Possible IF of 10.145
Motorola is more famous than GE for using weird IF freqs to thwart
possible use of "common" crystals in their equipment but most anything
is possible. Like I say, I's sure the xtal supplier will have all this
stuff already so you just have to give them the info and send the
money..

Wilmington, DE 19886-5515

Check your billing statements closely. If you have been charged a late fee even though your payment was mailed prior to the due
date you should report it to your state attorney general. If your finance charges are being listed as purchases you should contact your
state attorney general. If your credit card company is unable to funish a copy of a signed billing receipt you should notify your state
attorney general.

All the events described above could make you a party to a class action suit against your credit card company where you could
collect up to ten times the amounts you were falsely charged.

For more information contact your state attorney generals office.

Having been "brought up" with warnings of popcorn noise,
I actually ran into it in an audio mixer device not too
long ago. I shall refrain from mentioning the manufacturer.
At least I instantly knew what it was, and it did sound like popcorn.

> unless we can couple the hits back into the browser gracefully.

I don't think grep searches are going to go over too well. "Coupling back into the browser" is one objection to using HTML and standard browsers. Another is that HTML doesn't give you a lot of page-layout control. It leaves a lot up to the browser, and not all browsers work quite the same. By the way, "everyone" doesn't feel comfortable with a browser. Believe it or not, there are still quite a few people who are equipped with a computer but don't browse the Web!

> OTOH, PDF preserves the *look* of the original magazines. There may

> reference, but I'd be happy to see that retained as image files of
> each bit of ad copy.)

I'm not sure the look is that important. All else being equal, it would be nice to retain the look. But all else isn't equal. In Acrobat, for example, try selecting text from a multiple-column page and copying it to the clipboard. (Hint: It won't restrict the selection to a single column, resulting in an unusable mess on the clipboard.) Another drawback to PDF is that it's slow. That's less of a problem as time goes on and computers get faster, but it's still a concern for now. PDF has some strong features, and we may make use of it in the future. But it's not a perfect solution by a long shot. HTML is even less so.

Which brings up the question: How much compromise in functionality should we allow in order to achieve multi-platform operation? When one platform is by far the dominant one in use, it's not unreasonable to answer that question: "Not much compromise." Of course, if you're not using the dominant platform, that's not a satisfying answer. Believe me, I understand that. We'll keep evaluating the possible solutions to multi-platform support that emerge.

578. Re: Need high voltage transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-16 00:00:00 UTC
From: tiemann@spot.Colorado.EDU
Message-ID: <5bmbom$atf@lace.colorado.edu>
Source record: 98431

You don't mention the exact voltage or current required. I recently liberated a perfectly functional transformer with a ~1900 V secondary from an abandoned (by the side of the road) microwave oven. I knocked out the magnetic shunts, and it works fine. However, one end of the secondary is connected to the core. (Even if this connection is broken, there will be little insulation between the core and the first layer of the high voltage winding.) I haven't loaded it heavily to see its full-power output, but one might imagine it will be in the high hundreds of watts, that is, a few tens of mA for ~2kV output. Coming across unwanted or garage- or moving-sale microwave ovens is probably not difficult.

My transformer also has a 3.3 V secondary for the filament, and a 115 V one-phase primary as you indicated you wanted.

Some people on this group indicated the regulation, even with the shunts knocked out, will be poor compared to "real" HV transformers, but it might be just fine for you, and you won't beat the price! Peter Dahl, for example, makes high-performance transformers of this type, but his products are full price. There are also the HV manufacturers, like Universal Voltronics, Del High Voltage, etc. They make HV power supplies and systems, as well as HV components such as transformers. (They also go up to ~100 kV, should you need to power an accelerator or X-ray tube.)

> higher.<<-<<

I know who Mr. Rauch is quoting above, but readers, other than Wes, N7WS, probably do not know. So far, the person who made this statement has not come up with a conventional suppressor that will reduce the VHF voltage gain of an amplifier by the same amount as a nichrome suppressor. Sure, I can come up with a suppressor design using a high-Q silver-strap Ls (with a different amount of inductance) and a different amount of resistance for Rs, which yields a much lower VHF Q than any of the suppressors Wes measured for us. However, such a suppressor creates a 'gotcha'/land mine that the naysayers don't seem to be aware of yet. ....Stay tuned for the next exciting episode. (Note: this gotcha is discussed in an article about VHF suppressors that appeared in the March, 1989 issue of QST magazine.)

...snip...

> This conclusion above is the same conclusion I reached, ... snip

What are the values of Rs and Ls that will produce exactly the same VHF Q, Mr. Rauch?

...snip...
> If the data is reviewed, the ratio of Q is almost unity at 200 MHz and
> over 2:1 at 10 MHz. Just the slightest adjustment of R or L will make the
> conventional suppressor equal the nichrome at VHF, while maintaining
> better Q at HF where we want losses to be reduced.

Is a 1% (0.087db) loss at 29MHz going to make a difference at the receiving end? Is a 0.25% (0.022db) loss at 14MHz going to make a difference? Every benefit has a trade-off. Is a 1% power increase at 29MHz worth a 2/3, or more, increase in VHF voltage gain?

> For example, the AL-80B oscillates at about 170-180 MHz when the
> suppressor is removed.

However, AL-80s seem to occasionally oscillate at roughly 160MHz with the factory suppressor installed. Here's a clip from an e-mail I recently received from an AL-80 owner who reportedly had two bandswitches fail.
"Hi Rich: Sorry for the delay but we were out of town. I am sending

you 2 sets of toasted AL-80A bandswitches. The first time it arc'ed over
, I
had no idea what the problem was. Since I only used it on 75 meters, I
thought it had wimpy bandswitch wafers in it and that was the problem. I
then soldered the bandswitch in the 75 meter position and of course then
when it arc'ed it mad more of a mess than the first time. I had a
chance to put your suppression kit in and what a difference. You of
course knew this would be the result, but I am most pleasantly surprised.
The amp tunes up nice and smooth now with no crackling and popping
sounds emanating from inside......."
When Rick's 'toasted' AL-80 bandswitches arrive, I will post photographs
of them on the Web for all to see. ....Once again, Mr. Rauch has
been proved to be correct---i.e., the tune capacitor in the AL-80 has no
resonances around 160MHz that could cause it to arc over from a VHF
parasitic oscillation. Congrats, Tom.

> At that frequency, Wes measured a Q of about one
> (same as I posted weeks ago). The Q of a duplicate nichrome suppressor is
> about .75. This very small Q change is diluted by circuit effects when the
> suppressor is installed in an actual PA. The actual operating Q change
> would be even less at VHF, and more at HF.

Now that we have Wes' measurements, we know that a fairly typical low Q
suppressor has an ESR of 4.32 ohms at 30MHz and an ESR of 0.88 ohms at
10MHz. Perhaps Mr. Rauch, or another 'recognized amplifier expert' can
show us how to calculate the effect this would have on the Q of the tank
circuit in an AL-80B at 10MHz, and at 30MHz? These calculations are beyond
my capabilities.
>
> Rich's claim this small change in VHF Q is a great or worthwhile
> improvement that cures all woes is completely false.

Granted, the claims about mirculously curing gout have not been verified
by a double-blind scientific study, but preliminary evidence suggests that
verification is absolutely, positively, 100% certain.

...snip...
> 1.) The Miklos employment tale. He claimed he "called Eimac" and they told

> only that, VHF Handbooks list Buzz as Eimac's former R+D Manager. Even
> after the employment confirming letter was out, Rich sent Buzz Miklos a
> post card telling Buzz he was never R+D manager!

Curiously, Mr. Rauch does not quote what I wrote. In the postcard, I
told Mr. Miklos that someone on this newsgroup was providing information
about his prior employment at Varian-Eimac that, according to the
Varian-Eimac's personnel department, did not match his personnel records.

> 2.) The tale about Marvin Born. Rich said Marvin measured parasitics in an
> AL1500. Turns out it wasn't even an AL1500, it was a dual 8877 PA built on
> a old empty prototype chassis. When I talked to Marvin he said he was

> positive Rich knew he was talking about a west coast manufactured 3CX3000
> PA, and not a AL-1500.

True, it was retrofitted with a second 8877. As I recall, tank
modifications were made to the AL-1500's tank to double the power handling
ability and halve the input Z in order to match two tubes instead of one.
However, Mr. Rauch's statements are somewhat puzzling. First Mr. Rauch
tells us it was a 'dual 8877 PA', but then he tells us it was a Create
Electronics Co. 3CX3000A7 amplifier.
If Mr. Rauch is correct, Marvin Born ordered the WRONG suppressor
retrofit-kit. To explain: According to my records, Marvin ordered kit
s/n 4548, which was for an AL-1500 with an extra resistor set for a second
8877. As I recall, Marvin told me that the AL-1500 had no VHF parasitic
suppressors and that he could see intermittent VHF parasitic oscillations
at 87MHz on a Tektronix 454 oscilloscope as well as on a spectrum
analyzer. According to my records, Marvin Born sent a cheque to pay for
suppressor retrofit kit s/n 4548. However, a suppressor for an AL-1500
would prompty incinerate in a 3CX3000A7 amplifier. I just telephoned
Marvin to see if a mistake was made. Unfortunately, no one was home.
I'll try again later.
>
...snip...

> 7.) Measures' attempt to blame me for Wes' unintentional error. Rich was
> completely aware of how this happened BEFORE he posted his pathological
> accusation that I was trying to hide something, and that I misled Wes.

'Unintentional error'? To the best of my knowledge, Wes did not error
anywhere.
RE: hiding something: Mr. Rauch cancelled his post of 28 November,
sans-explanation. I believe the reason why Mr. Rauch cancelled this post
has something to do with the belated realization that a small change in
VHF Q affects a large change in VHF Rp.

> When all this is considered it becomes perfectly clear Measures presents
> untrue statements as fact, even when he should have known in advance what
> he says really isn't true.

Mr. Rauch names no such statements. However,, in his next reply, perhaps
he will take me to to task on the gout issue. .

> We all make occasional mistakes, but this stuff goes far beyond once in a
> while. It appears to be chronic or habitual.
>
Amen to that, Mr. Rauch.

A question: An Rs of 100 ohms is connected in parallel with an Ls of
85nH. Assuming that the intrinsic L in Rs is zero, and the intrinsic R in
Ls is zero, please calculate the currents in Ls and Rs if 1V at 160MHz
when applied. In your expert opinion, Mr. Rauch, is the resultant current
in Ls insignificant compared to the current in Rs?

POSTSCRIPT
Did anyone notice that Mr. Rauch avoided the subject of Rp? When evaluating suppressor performance, Rp is is an important consideration because Rp and tube mu determine VHF voltage gain. Since we can't change the mu of the tube, Rp is the only game in town for VHF voltage-gain reduction.

Hi Mike,

I am currently becoming active on 23 cM EME and of course NF is a big subject. I had my LNA built by KB2AH and NF optimized. The equipment ensures that the LNA is looking into 50 Ohms.
When I built my dual circular feed in addition to looking at circularity, isolation etc. I used my HP network analyzer to adjust the feed for a return loss in excess of 25 dB. Therefore it seems to me that the LNA should play the same on my feed as it did on the NF equipment as they are both 50 Ohms.
You are certainly correct that the input Z of the LNA is most assuredly something other than 50 Ohms if it has been noise optimized. The old gain/NF tradeoff.

I thought amateur radio was a hobby. You are supposed to have fun
doing something that you like. For some it is talking, for some like
you it is doing stuff like measuring the energey of the quantum band
gaps of hot carrier diodes over temperature :-)

>I shouldn't even HAVE to tell you this! Half the hams I hear these days

That is kind of hard to believe. The extra written exam is a cake walk,
but the advanced class is about the same as a commercial radiotelephone.
Those extras must have been one of those people that memorized every

question in the pool.

I already sent this to Joe by email, but I guess I should post it here,
too.

From our own experience and from talking to commercial service bureaus,
OCR is just out of the question. The technology isn't yet up to
producing error-free text from scanned pages. And we're talking about 80
years of QST, after all! It would be a massive job to OCR, then fix and
mark up (if you want links), 80 years of QST text. Plus scanning and
separating all of the graphics. We'd have to charge many times what we
charge for the QST View product--no one would buy it.

True, but all of them put together consist of a miniscule part of the
potential market for ARRL products. Nobody (outside of Redmond) likes
that fact, but it's true.

The index for a 5-year set (85-89), stored in ASCII form on the CD-ROM,
is well over a megabyte. While that represents one of the larger 5-year
indices, the total index for 80 years of QST will clearly be many
megabytes. No browser I know of will handle a search of a document that
large well, if at all.

You're right about that. We spent no time looking at platform-specific solutions for platforms for which we can't sell significant volume. We looked at cross-platform solutions, without success, and Windows solutions. (One minor correction to what I said in the posting--it's Group 4 compression, not Group 3.)

> It's a shame I don't have the V-REXX developer package and a little free

> content.

We're planning to look closely at PDF for future products. PDF and PDF tools have come a long way recently. But they aren't a viable solution for "legacy" documents--such as older QST issues--that aren't in Postscript form.

Calvin, if this may be of any help, Mouser has an whole page of dipped mica capacitors at 500WDCV. In the range you're looking for they have 1,5,10,12,15,18,22 pf at different lead spacing. Maybe 2 x 5pf in // could suit you.

Contact me if you want more specifics

591. Need high voltage transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-16 00:00:00 UTC
From: Winston Chan <wkchan@icaen.uiowa.edu>
Message-ID: <32DE4F09.27EB@icaen.uiowa.edu>
Source record: 98444

I am repairing a high voltage power supply and need a transformer with about 1500 V secondaries for line voltage (115 V) input. I have checked the major transformer manufacturers and they all seem to have stopped making transformers with secondaries of more than a couple of hundred volts. Does anyone know of a source for high voltage transformers?

Hi all,

I have two 2.4GHz frequency-hopping spread spectrum tranceivers (100 mW each). I would like to construct two directional antenna systems (parabolic dish? yagi? helical?) that would give me a range of 20 miles or so. The two sites where the radios will be located are pretty much line of sight (except for maybe some trees and other variable terrain). Any suggestions? Any ideas where I might find related info on the net? Thanks in advance....

599. 3-500z help

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-17 00:00:00 UTC
From: w8pu@aol.com
Message-ID: <19970117005901.TAA16538@ladder01.news.aol.com>
Source record: 98452

I have a first generation Prime Industries AL80 amplifier and I would like to know just what is the max current that should be applied to the single 3-500z grid. Also what is the max key down plate current. The manual suggests no more than 100 watts input but this amp will put out 700 watts with as little as 60 watts and 150 mils on the plate. This is approx a KW input if the amp's meter is accurrate. This amp will do almost 900 watts if pushed to the 100 watt max input suggested but the grid current is closer to 200 mils or more. I use this amp for SSB mostly and I am more interested in the tube's life than an extra 100 watts or so as it realistically is not going to make my signal any better.

Thanks de Gary W8PU

601. PicCon Hidden Transmitter Hunt Controller

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-17 00:00:00 UTC
From: byon@netcom.com
Message-ID: <32e0df9f.10329212@news.hlc.net>
Source record: 98454

Greetings to fellow T-hunters and T-hiders,

I have recently created a new microcontroller-based hidden transmitter controller called PicCon. It connects to a radio transceiver and produces tone sequences and Morse code messages at user-programmed times. It is completely field programmable via DTMF tones, remembers all options even when power is removed, runs off a 9-volt battery (or any 7-35VDC source), and is quite compact (1.9" x 1.7" PCB.) PicCon also supports synchronized multi-transmitter hunts, and can operate under IARU T-hunting standards. Look for it in the March 1997 issue of 73 magazine in Joe Moell's Homing In column.

Kits are available, which include a manual, and all parts necessary to build the printed circuit board, excluding a chassis. A power/radio interface cable is also included, but must be wired for your specific radio. Kits are $49 plus $2 S/H and can be built in about 30 minutes.

Further details can be found at the PicCon Web page where I have on-line copies of the User's Manual in PDF, HTML, RTF and TEXT formats. If you do not have web access, I would be glad to eMail a version to you. The web page URL is:
http://www.kvoa.com/byon/piccon/
Additional questions can be directed to me via eMail.

Thanks, 73, and good hunting (and hiding.)

602. soldering iron tips

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-17 00:00:00 UTC
From: sw1gak@polaris.mindport.NET
Message-ID: <Pine.SUN.3.94.970116213846.1847A-100000@polaris>
Source record: 98455

I have a pace solder station that needs new tips for the soldering iron. Ordered some from Jensen tools and got the wrong ones. Returned them with no hassle.
Needing a new tip in a hurry I made 2. One from .125 stainless welding rod and one from .125 brass brazing rod. The stainless tip does't transfer heat very well. The brass tip works very well.

Does anybody know of any problems I may have using the brass tip in place of the iron clad copper tip?

I tinned both tips using duzall flux and used anti-seize compound.

610. How to couple rx & tx to antenna ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-17 00:00:00 UTC
From: esies@mxsb30.ms.philips.nl
Message-ID: <5bnn7f$icj@news.best.ms.philips.com>
Source record: 98463

Hello,
For a so called 'multiple choice system' I have to make wireless (433.9MHz rf) data links. I plan to use those commercially available short range modules.

The system is based on a single master (a PC) and multiple slaves (the response button boxes). Each unit has a half duplex rf link, consisting of a small (ca. 0.1 mW) transmitter and a receiver (either a superreg, or a single conversion superhet in case of AM transmission, for FM the receiver is a double conversion superhet).

The integrated FM transceivers incorporate a kind of rx/tx switch, the individual transmitter and receiver modules don't. What are the possibilities of some passive splitter, anyone wants to share experience ?

Best regards, Erik Sies
esies@best.ms.philips.com

611. TX ATU for 10/11m

Newsgroup: rec.radio.amateur.homebrew

612. Ten-Tec Omni-A Series B Mods

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-17 00:00:00 UTC
From: drallen@prairienet.org
Message-ID: <5bo8qa$o7r@vixen.cso.uiuc.edu>
Source record: 98465

The Omni Series B had a receive only 10MHz position as well as a AUX position in the original design. In previous years, Ten-Tec would convert the two bands for transmit capability on 10MHz and set up the AUX position for receive/transmit on 18MHz. Because of the age of the rig, they no longer offer this service.

Does anyone have info on homebrewing/winding the necessary toroids in the BPF and LPF sections of the Omni and the changes required to the Osc-Mixer board for the above bands. Obviously, correct xtals and some wiring jumpers have to be installed on the osc-mixer board, but any info on this would be helpful.

Tnx,

Don Allen W9CW (Ex-N9ALK)

Well, I'm one who would prefer to modify page layout, fonts, and
colors to fit my display, so HTML is a plus for me. I want to be able
to comfortably view the text whether I'm using my PDA, my laptop, or
my 17 inch SVGA display, or a subwindow on any of them, but I addressed
that in the previous message. As for people who aren't familiar with the
browser metaphor, if they follow the Microsoft path in OSs, they'll have
to learn. The next versions of Microsoft OSs are going to use the browser
metaphor *as the desktop*, according to a Microsoft press release.

>Which brings up the question: How much compromise in functionality
>should we allow in order to achieve multi-platform operation? When one
>platform is by far the dominant one in use, it's not unreasonable to
>answer that question: "Not much compromise." Of course, if you're not
>using the dominant platform, that's not a satisfying answer. Believe me,
>I understand that. We'll keep evaluating the possible solutions to
>multi-platform support that emerge.

If things develop as expected, in a short time HTML will be the default
browseable text format on all platforms, and the Java VM will be the default
platform regardless of what underlying hardware or program loader the user
may be running. Sun is pushing this, Microsoft has signed on board (with their
usual non-standard modifications), Apple has agreed, and the other players,
notably the major application software vendors, are lining up to follow the
crowd.

With the advent of JIT compilation, there isn't even a significant
performance penalty to running on a virtual machine. And this scheme
will be transparently network aware, regardless of the mix of platforms
on the network. It won't matter if the client is on your machine or
elsewhere on the network, access to your screen through your server
will be the same in every case. X Windows brought that partially to
unix some years ago, the browser metaphor and the Java VM will bring
it to every platform and OS over every sort of network, and on your
local disk.

But even if that vision doesn't materialize, it is becoming increasingly
important to have data in a platform and OS independent format. Even if
the tools you include to manipulate the data are platform or OS specific,

the *data* should not be. So perhaps you'd only include a Windows *viewer* on your CDROM, but the data should be accessable to tools available on other platforms and OSs. PDF shares this independence with HTML, but not *transparently* over networks. That's why I think HTML will win out over things like PDF.

What the Fortune 500 is percieved to want is what drives application developers (and the OS vendors who support them). And what the Fortune 500 says it wants is scalability and transparency over the network. They want all software to be defacto capable of being groupware. They want any application to be able to share and use any other application's data. And the vendors are finally taking these demands seriously.

Gary

With an ohmmeter, figure out how the windings are hooked up.

Then with a 6V transformer, excite the lowest resistance
winding and measure the voltage on the other windings.
Use a voltmeter that's safe to at least 1 KV, and if you've
got one, use an isolation transformer with the 6V transformer.

Recently inherited a GE "MLS" Series radio. Looks like the year was 1988. It's a two channel business radio set for 151.805.

Anybody aware of mods available to convert this into a 2-meter packet station?

Please post mods here or to: shelby13@bright.net

Thanks for any information.

I'm not familiar with this transformer, but I have figured out the ratings of many using the following method.

take an ohm meter and find all the taps with continuity, and write down their resistance. Find the pair with the highest ohms, and connect it to preferably a variac, but if not plug it in with a fused line.

Measure the voltage on the taps you found continuity, and then determine the ratios of the taps to each other. What you probably have is a power transformer with taps for 125v, 120v, 115v, 110v 105v, and then a couple of centertapped secondaries.

The reason I always power the highest resistance is if it is a HV transformer you don't have 1000volts or so floating around. I also have seen people connect the 115v on the 125 to 120 volt tap of the primary, quite spetacular results.

Good Luck

From: ylshih@alumnae.caltech.edu
Message-ID: <5bomcg$ksq@gap.cco.caltech.edu>
Source record: 98473

Trying to upgrade my home test bench. I have the following test
equipment for sale:

VHF/UHF band spectrum analyzer - $1700

HP141T Spectrum Analyzer System (Brand new storage tube - perfect)
HP 8552B - IF section plug-in
HP 8555A - 10 MHz to 18GHz plug-in (40 GHz w/ external mixers)
HP 8445B - 10 MHz to 18GHz Tracking Preselector
includes all manuals and calibration in past year

Audio band plug-in - $300

8556A - 20 Hz to 300 KHz plug-in
(w/ built-in tracking generator)

HF Band plug-in/tracking generator - $500

HP 8553B - 1 KHz to 110 MHz RF plug-in for HP141T
HP 8443A - 1 KHz to 110 MHz Tracking Generator/Counter for 8553B
includes manual for 8553B and calibration in past year

All fully functional - in fact most the above is also recently
calibrated as well as the new storage tube. I will make a package
deal of the whole system, which will cover spectrum analysis from
20 Hz to 40 GHz for a total price of $2250, an additional 10%. I
would prefer to sell the whole package, so offers for pieces will
be held temporarily.

Tektronix 2246A 100 MHz Oscilloscope - $1100

Recent Tek model 4 channel scope with on-screen cursors,
digital voltmeter, auto-calibration, setup memory, 2 probes,
almost perfect condition.

The max. anode/plate I rating is 400mA according to Eimac. No maximum grid current is specified. The typical drive power varies with anode supply V. More V means less drive power to obtain 400mA of anode current. At 3kV, somewhere around 65w will produce 400mA of anode current. If a healthy 3-500Z is driven to more than about 420mA, distortion increases rapidly. Some, IMO unethical, manufacturers of single 3-500Z amplifiers claim that it's okay to drive a 3-500Z to more than 500mA. With 100w of drive power, such currents are possible, but the signal will be severely distorted, and splatter on adjacent frequencies will result. By placing approximately 20 ohms in series with the cathode DC blocking capacitor, to provide RF negative feedback, a 3-500Z is harder to overdrive with the typical exciter.

What does the AL-80 owner's manual say about 'plate' current, Gary?

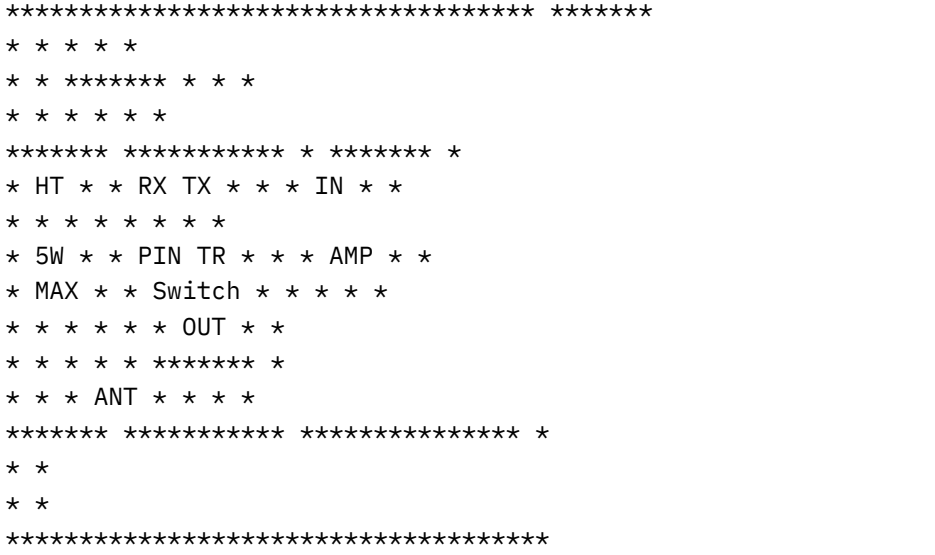
From: JOHNWHITE@gnn.com
Message-ID: <5bnv5c$l48@news-e2b.gnn.com>
Source record: 98476

I am constructing a 2M amp (less than 50 Watts out) and want to know if I can connect my PIN diode TR switch this way:



This setup uses only one PIN diode TR switch. Points of concern are:

1) Received RF is present at amp input during receive. Shouldn't be enough to turn on amp though. If it will turn the amp on; I can slightly attenuate the RF going to the amp input since I don't need all 5 Watts to drive the amp, thus reducing RX RF at the amp input to a low enough level.

2) 5 Watts max output from HT is present at RX connection of PIN diode TR switch during transmit. Assuming that it can handle 5 Watts RF there, that shouldn't be a problem.

3) Am I out of my mind?!

>
I just had a conversation with Marvin Born. He said the amplifier in question was built on an AL1200 chassis, had two 8877s, now has one 8877, and uses a low VHF Q parasitic suppressor intended for an AL-1500.

Mr. Rauch is correct in stating that Marvin's spectum analyzer detected a parasitic-oscillation (at 78MHz) in a Create 3CX3000A7 g-g amplifier that had vapourized various bandswith contacts and destroyed its VHF parasitic suppressor. Marvin said he replaced the bandswitch, and replaced the factory-stock parasitic suppressor with an all-nichrome, resistorless, low VHF Q parasitic suppressor. No further arcing problems have been reported.

Congrats, Tom

My first rig in '66 was a used Heath DX-35 that had a grid-modulated 6146 final setup (essentially a DX-20 with grid modulation added for AM). It worked, and was cheap, but the modulation was never equal to a plate modulated setup - my audio was always weak, but the rig was $20. used and was all I could afford. Still, it was a compromise sollution at the time to save transformer cost, etc.

I found a General Electric 25uH roller-L in my toolshed, in which i store ammonium sulphate fertilizer among other things. This roller-L was made during WWII, when there was a shortage of copper. The coil wire material is silver instead of silver plated copper. A layer of black silver sulphide had formed on the wire during the past 12 years. I did not clean the wire.
I evaluated the roller to coil contact resistance with a current of 2A. The source impedance was 4 ohms. I measured the voltage-drop between the coil and the roller with sharp tipped probes so that I would penetrate to bare metal. This voltage averaged about 80mV after several roller passes. At numerous points on the coil, some kind of breakdown effect appeared to be taking place--i.e., no current initially flowed, but current began flowing almost immediately. After several roller passes, the coil to roller voltage-drop remained fairly constant.

:>My mla2500 roadmap says these 5 caps have a rating of 500v. I don't know
:>of any source of 500v electrolytics.

The MLA-2500 has had several values of filter capacitors over time.

My original schematic shows the six (6) power supply filter capacitors
as
150 uF at 450 Volts. At some time there was a note in the parts list
changing the capacitor values to 100 uF at 500 volts. My spare parts
stock contains a couple of Mallory FP-155, 125 uF at 450 volt
capacitors,
that were left over from a "minimum quantity" purchase when I had to
replace the caps several years ago.

In any case, since the MLA-2500 uses a voltage doubler power supply, any
redesigned filter band will require an EVEN number of capacitors ... six
or eight, not five or seven.

The brass tip will need more frequent tinning, and its life will be
shorter than iron plated copper, but otherwise it should be fine.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

$$$$ This is what many people call A $$ scam but, IT WORKS you can't lose!!!!!!$$$$

Take five minutes to read this and it WILL change your life.

The Internet has grown tremendously. It doubles in size every 4 months. think about it. You see those 'Make.Money.Fast' posts more and more. That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, whats $5.00!
So I sent in my money and posted.Everyone was calling it a scam, but there are SO many new users!

Well, two weeks later, I began recieving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, the By the end of the fourth week, I had recieved nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking this serious.

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill inside each paper, and mail them to the folowing adresses:

1-M Palmer Gilfach Goch,Blaenpenal,Aberystwyth
SY23 4TN ,United Kingdom

2-T.Toole box1138,Valemount B.C
Canada VOE-2ZO

3-Vitor Schlrder de Borba
Av Lucas de olivieira 2280 ap 404
90460-000 Porto Alegre/RS Brasil

4-Evert jan Benz
nijensteinheerd 58
9736 TD Groningen
Netherlands

5-J.J. Alles
RR 2 Site 81 Comp 6
Smithers, B.C.
V0J 2N0
Canada

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 250 newsgroups. There are at
least 19000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can. Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the Internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250
additional postings with your name at #4, 1000 postings. On
average then, 50 people will send you $1.00 with your name at
#4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your
name at #3 or 10,000 postings. Average return, 500 people= $500.
They make 250 postings each with your name at #2= 100,000
postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at
#1 and you get a return of $60,000 before your name drops off
the list.And that's only if everyone down the line makes only 250
postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list,
you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through
and repost this article everywhere you can think of.
The more postings you make, the more cash ends up in
your mailbox. It's too easy and too cheap to pass up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it
works. There are millions of people surfing the net every day, all
day, all over the world. And 100,000 new people get on the net
every day. You know that, you've seen the stories in the paper.
So, my friend, read and follow the simple instructions and play
fair. Thats the key, and thats all there is to it. Print this out
right now so you can refer back to this article easily. Try to keep
an eye on all the postings you made to make sure everyone is
playing fairly. You know where your name should be.

If you're really not sure or still think this can't be
for real, then don't do it. But please print this article and pass
it along to someone you know who really needs the bucks, and see
what happens.
I've been perusing usenet for a few months now and I've seen these ads
appear very often. Like you, I thought that these postings were a
complete annoyance and a waste of time. But after reading dozens of them, I
decide 'For the sake of only 5 dollars I'll give it a try'. But the
reality is that it DOES work and you are guaranteed to receive large
sums of money, legally.
Make sure that you put your correct mailing address,
especially if you're from another country as some people have never sent
mail out of the country and might not know how. You may alter this
article
if necessary, editing what you need to edit.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS!
GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages
with your name in the list and not sending the bucks to the people
already included, you will not get much. I know someone who did this
and only got about $150 (and that's after two months). Then he sent
the 5 bills, people added him to their lists, and in 4-5 weeks he had
over $10,000!

TRY IT AND YOU'LL BE HAPPY!!! :o) !!!!!!!!!!

INSTRUCTIONS ON HOW TO POST USING NETSCAPE 3.0

1. Click on any newsgroup like you usually would, then click on
"TO:NEWS" in upper right hand corner. This will bring up a message box
to type this article in.

2. Leave the message box like it is, don't maximize it. In Subject
box type something flashy like "$$$CASH READ HERE$$$".

3. Tab once and you are ready to type in the body of the box. Retype this article but with your name inserted in slot #5 and the others moved up as I directed. Remember the #1 in this article will be removed in yours.

S. Pypke tells people to retype the article. This may not be necessary. Try this: highlight the article with a mouse (or click edit and click select all). Then, click edit, click copy. Then, go to notepad, or Word, or WordPad, or Wordperfect. Click paste. Save it from there. To post, highlight from notepad. Click copy. Go to the mail section to post, click paste. Go on from there. This will make it easier.

4. When you are done retyping this whole article with the proper changes, click on FILE in this message box (it is right above SEND). Click on SAVE AS under FILE (make sure your in the newsgroup message window, not where it says Netscape News) Save your file as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS!!! Once saved move to next step.

5. To post to at least 200 newsgroups do the following. You can post to more which will bring you more money but 200 is the bare minimum. Go to a newsgroup you want to post in. Click on "TO NEWS". Write your subject just like you did when you retypd this article. Hit tab once. Now click ATTACHMENT.
Another box comes up. Find your file where you saved it. Highlight the file and click "OPEN". Now click OK. If you did this right you should see the file name in the Attachments box in shaded letters.

6. NOW JUST CLICK SEND. Do this to at least 200 newsgroups (there are over 18,000) Each time it takes no more than 30 seconds so once you have retyped the article its easy.

INSRTRUCTIONS FOR EXPLORER

1. Holding down the left mouse button, highlight this article. Then press "CRTL" key and "C" at same time to copy this article.

2. Print this article for reference.

3. Go to Newsgroups and press "POST AN ARTICLE", a window will open. Type your headline in the subject area and click in the large window below.

4. Press "CRTL" and "V" and the article will be placed in the window. If you want to edit the article, do so and then highlight and copy it again. Now every time you want to post the article in a new newsgroup just do the "CRTL" and "V" command and press Post"

: > voltage levels involved, the frequency range, and how to pick up the
: > signal. If the signal can be displayed on an oscilloscope?

Sure! Just boost it with a high gain amp. A differential amp with a gain
of 100,000 or so and a frequency response of DC-150 Hz (a couple of
op-amps will do it). Keep the input leads short to avoid picking up 60Hz.

Specs on waves 10-50uV 1-150 Hz. Go to the library. There is lots of
stuff there.

Tom: given that fact about flat conductors, may I ask your opinion of
the ribbon style variable inductor used in old military auto tuners, the
style where the ribbon unwinds off of a brass drum onto a ceramic
form? At least there is no roller with a point contact against a wire.
(although the end shaft contacts are fairly small).

I would also like to ask you about the common practice of connecting a
roller inductor so that as it varies, a varying number of the turns
become a sort of shorted secondary winding in an autotransformer.
Doesn't this destroy the Q of the system too? I heard that the reason
for this configuration of connection is to avoid a high voltage
situation. Is that true, or is it to make tuning adjustment less
critical?

We are tring to set up a set of old duplexer(we have no paper work on them). It is a six cavitity set, three band pass and three band reject. the cable harnness was not attached to the cavities when we got them. We hook the three reject cavities on the reciever and tuned them to reject the transmitt freq(146.97).we hook the threee band pass on the transmitter and tuned them to pass the transmitt freq.(146.97) We are get about 9 to 12 db of lose on the recieve freq(146.37) thur the band reject filters . What did we do wrong ???????

>Congrats, Tom

It's not just this time Rich, it's nearly all the time. When your stories
are looked at, they almost always wind up being little tiny threads of
fact woven into big fabrications. It's just an attempt to support your
view of how the world works.

When any person repeatedly posts or distributes factoids that are almost
entirely figments of imagination, he looses all credibility. You've done
that over and over again.
Even when you admit being wrong, you still can't control yourself and
"slip in" another false claim!

Look at a small part of your history on this thread:

If Dave had not corrected you in public about the real cause of his
TL-922's arcing (a bad lightning arrestor), you likely would have posted a
picture of the capacitor on your web page and slammed Kenwood even more
than you have for parasitics. You declared the 922 cap damaged from
parasitics, sent Dave a kit, and almost got away with "another one"
except, before installing the kit, Dave found the problem. (By the way,
that was a problem you said could NEVER occur. You plainly said HF signals
or improper loading or antenna termination could NOT cause a PA to arc.)

Just hours after that, WB8BFS came on the thread and said his 922 arced
from a bad relay.

More recently you declared all amateur PA's poorly designed because they
had no rheostats like commercial transmitters, and declared no proper
engineer would purchase a transmitter without one. Several people rebuked
you for saying that, one of whom is a top notch engineer for a large

commercial BC transmitter manufacturer.

Now you've moved on to the AL-80 or something with more Richard L.
Measures picture "evidence". Once in a while you'll find a sucker who buys into your fantasy, but your days of misleading large numbers of people are over.

>roller voltage-drop remained fairly constant.

Eight volts at two amperes could easily destroy any resistive layer.

When silver plated relay contacs fail to connect, all that is required is
application of a few volts at a few mA and the contact is "healed". That's
why relay contacts have a minimum current design rating, as well as a
maximum.

If you would have measured the contact resistance with a very low current
very low voltage meter, it would have shown something. You ruined an
excellent opportunity to prove something.

Source record: 98498

I bought a Titan DX II from Gap. In the middle of september 1996 I
erected this antenna but had some problems with the swr on some bands.
I wrote a letter to Gap, after six weeks I got an answer and an other
Cap for the 80 meter band. They gave instructions, but I have still
problems. So they promised to sent an other Cap again, wich was 7 weeks
ago. Until now I received nothing and a letter and several e-mails were
not answered. The PACC contest is coming, then my antenna must be good.
Who has a better address than gap@digital.net, or who can help me in an
other way ?
73 de Bart PA3GGM
In the beginning there was nothing, therefor I'm satisfied now

I've never seen one, or measured one, so I can offer no real opinion other
than my earlier general statements about flat conductors.

>I would also like to ask you about the common practice of connecting a
>roller inductor so that as it varies, a varying number of the turns

Q reduction is often very slight in an air core space wound coil mounted
near a chassis when turns are shorted. If turns are shorted in an optimum
Q coil mounted in an optimum location, Q reduction can be large.

I never short turns in a mobile loading coil, because the ratio of loading
to unloaded Q can sometimes approach unity, I also keep my loading coils
far away from other metallic objects and poor dielectrics.

By the time you get an inductor mounted in place, any Q change caused by
shorting turns is swamped out (or diluted) by the sheet metal and
dielectrics around the inductor. Look at all the stuff around a roller:
The cabinet and chassis, end plates, roller shaft, contact wheel or
slider support rail, rolling or sliding contacts, shaft end contacts,
thick dielectric support bars, etc.

When shorted turns are added to the hodge-podge, little changes.

On the other hand if unused turns are not shorted, series resonances can
absolutely ruin performance.

Date: 1997-01-18 00:00:00 UTC
From: Walter Dunckel <wdunckel@ix.netcom.com>
Message-ID: <32E10559.3D77@ix.netcom.com>
Source record: 98504

Radio Tech manufactures many different kinds of transmitters and receivers.The smallest transmitter measures 30mm x 10mm x4mm(small). Pictures of the devices and more info can be found through a link at:

http://www.netcom.com/~wdunckel/small.html

The 433.92 Mhz "high" power transmitter transmits at 10mW output power and costs about $26.00 . The Receiver module is a little larger and costs about $37 to $42.00 depending on options. The more expensive receiver has a received signal strength indicator.

We have the following CD-R media for sale.

Brand: Pioneer
Type: Printable Media (Surface is blank for printing or labels)
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.99
Minimum Order: 10

Brand: Pioneer
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: Maxell
Type: Gold on Gold
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: TDK
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: Hewlett Packard
Type Gold on Gold
Size: 74 min (650 mb)
Price: 7.15
Minimum Order: 10
Lifetime Warranty

The Copy Cat Shop has all your CD duplication, replication, recorders,
software, and media needs.

If you have any questions or comments feel free to call.

Cordially,

653. Control via PC

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-18 00:00:00 UTC
From: Todd Peterson <elab@netins.net>
Message-ID: <32E14CB2.498C@netins.net>
Source record: 98506

We are pleased to announce that our new application note,
'Device Control via the PC' is finally available.

This application note covers such topics as PC control of lamps and motors
using solid state and mechanical relays, device control using both
BJT and power MOSFET transistors, stepper motor control using a transistor
array IC, as well as PWM motor control using the L293 H-Bridge. Connection
to the PC is made via our inexpensive EDE300 PC Interface IC. Code examples
are also provided.

Feel free to download a copy today; it is available at
http://www.netins.net/showcase/elab in the 'Integrated Circuits' section
under 'EDE300'.

Todd Peterson
E-Lab Digital Engineering, Inc.

P.S. - While you're there, visit our Electronics Resource Directory,
a freely useable directory containing over 500 categorized hot-links of
value to the electronics community.

> filters . What did we do wrong ???????

Are you sure they are band reject and are they set to reject high or low?
Get them hooked to a spectrum analyzer WITH tracking generator and look
at the curve of them in wide more (say +/- 5-10 Mhz from center) it may
tell you something....if the pass looks better on one side than the
other, they may have been built for high pass low reject operation...

Also 3 BP only on the TX side likely will NOT be enough for a 600Khz
split....BP caivites are inherently wide spaced...so use on a narrow
spacing like 600Khz will usually not work....3Mhz or more is best for
BP....You probably need to make two of the TX side BR (notch) and try to
get better rejection there...the TX carrier AND noise should be notched
as much as possible on the rx freq...

>
> Thanks a lot!
> lbliao

Haven't seen any good references on subject. Have noticed one thing though; just about every kind of electronic amplifier exhibits popcorn noise at low frequency. Tubes do it, FET's, BJT's. Mechanism is different in each case, in each case related to manufacturing defects. Only common feature is sound, and spectrum, which tends to go as 1/f in power.
Was reading IEEE journal a few years back, and saw a paper on chaotic processes. Turns out systems with chaotic dynamics have power spectra that go as... 1/f. Hmmmm.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi,

Can anyone supply the protocol for remotely controlling the Kenwood TM621 / 721 transceivers? Kenwood sold the RC10 remote control, which connects to the 8-pin mic plug and (I assume) controls the radio via serial data on one or more of the mic plug pins. I'd like to build my own remote control.

Any help would be appreciated.

Thanks,
Bob N3HAT

Source record: 98510

I have been told to be sure and use electronic grade RTV for long term use in outside antennas in which the exposed ends of coax must be sealed for extended periods. What is this material and where can it be purchased? As a first guess I would think that it is RTV in which a non acedic base is use. If this is true, can any clear RTV be used that does NOT smell like acidic acid (vinegar) when opened? Cliff Buttschardt K7RR

<snip>

The february '97 issue of QST has an article starting on page 37 that describes such a project. The only [small :)] downside I see is that you either have to buy or program your own microcontroller for the project. I wish I'd seen this article before I bought Spectrum Electronic's "HRC-10 Handheld repeater controller" - although the HRC is a lot easier to program!

Hello...

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside the software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Be fore warned! A registered copy costs US$ 25, but after all, registered promotes the further development of this and other software while giving you the right to acquire all future versions paying only for delivery

expenses, if any.

Fianlly, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

:>The images are available at Figures 15a and 15b.
:>

The pictures are interesting and prove nothing.

The arcing visible in the pictures could just as easily been caused
by a mistuned amplifier running into a high VSWR. I'm sure someone
will correct me if I get it backward but in and underloaded amplifier
driving a high impedence load the voltage across the bandswitch (and
tuning capacitor) will soar nearly out of control. Underloading and
high feedline impedences are particularly common on 80 and 160 meters
as many amplifiers lack sufficient range in their output capacitors to
achieve proper loading ... particularly if the load impedence is very
capacitive.

Rule #1 ... if one hears hoofbeats don't expect zebras.

[lurk mode off]
Hmm... It depends. If the series capacitor is fully discharged when the leading edge of a pulse arrives, voltage at the input side will be higher than
at the output for a short time. However, the rise time must be shorter than
the time constant formed by the capacitor, the source and the load impedances.
The gas tube will not fire before coupling energy to the receiver, true enough
but the energy will only be a fraction of the original.
0.1 uF seems to be a very well choosen value.

>moving-sale microwave ovens is probably not difficult.

One solution to the problem of the grounded secondary would be to obtain
two identical transformers and operate them in the 2000-0-2000V
configuration. That will also double the available current, or halve
your problems with transformer voltage drop.

(So now you have 137 dead microwave ovens, and only two of them have
identical transformers? Is that a problem?)

In practice you would still need to un-ground the low voltage end of
each secondary in order to insert current metering resistors. The
voltage at the center-tap will always be very close to ground and there
will be no problems about insulation. These resistors should be shunted
by a high-current diode (anode to ground) for protection against
flashovers.

BTW, the Peter W Dahl Company is at http://www.pwdahl.com
Their amateur catalog is one huge downloadable page which seems to
contain every power transformer they ever made.

>capacitive.

Hi Joe,

That's basically the idea.

Anything that underloads the PA for the amount of drive power applied allows voltage to build up in the tank. The most common components ruined are either the bandswitch or the tuning cap.

Dave had that happen with his 922 Kenwood, when his defective lightning suppressors fired. Of course, Rich blamed it on a para$itic...and sold him a kit.

I wonder why ?

>I'm interested in hearing from anyone who has built
>a screen grid modulated HF transmitter.
You may not find many folks who've done so within the past thirty years. Now it's almost as efficient to use a linear amplifier as a screen-grid modulated amplifier. Screen grid modulation is, by its nature, efficiency modulation. If you have the amplifier set for, say, 75% efficiency at full output (four times carrier), your efficiency drops to 37.5% at carrier level. On the other hand, if you have a modern Class AB2 amplifier your efficiency at full output will be about 65%. The efficiency at carrier would only be 32%. In exchange for the 5.5% loss in efficiency at carrier level you get reduced complexity in the screen bypass area. The screen bypass not only bypasses RF; it also bypasses part of your audio signal feeding the screen grid. So the value you choose is fairly dicey. You don't want the audio driver's response rolling off too quickly.

It should be pointed out that good, linear screen modulation also requires either audio pre-distortion or audio feedback derived from the RF output signal. The screen voltage vs plate current curve is non linear so substantial second harmonic distortion must be introduced to stretch the negative peak and squash the positive peak of the modulating waveform to get a low-distortion signal.

Hope this helps.

I understand that you don't have any paperwork on this unit, but do you know who the manufacturer is? If it is a Sinclair duplexer, it may be of the hybrid ring type which requires tuning several stubs in addition to the cavities. You will find these stubs in the cable harness. If it is a Sinclair, you can contact them direct or E-Mail me at pauls1234@aol.com and I should be able to get you a copy of the procedure.

To Check out our Stun Gun offer ..keep readingï¿½

What is a Stun Gun?

A Stun Gun is an electrical self-defense device that puts out a high voltage and low amperage shock. By merely touching a person with the stun gun, he is immobilized for several minutes with no permanent harm. Stun Guns are considered reasonable force to resist attack. They can be used many times to ward off attackers before the batteries need replacing.

Our Current Best Seller is the "Talon 250"ï¿½."The Finest Stun Gun in the World!"

Features:

Curved Head.
Strength: 250,000 Volts.
Power requirements: 2 X 9V Duracell Batteries (included).
Complete with hand-strap and belt clip.

Effects of the "Talon 250":

The Talon 250 Stun Gun does not merely rely on pain for results. The stun gun works on the muscular and neural system. A short blast of ï¿½ second duration will startle an attacker, cause minor muscle contractions and have a repelling effect. A sustained blast of 1 to 4 seconds can cause an attacker to fall to the ground and result in some mental confusion. It may make an assailant unwilling to continue an attack. A sustained blast of 5 seconds can overwhelm and control the attackers neuromuscular system IM-mobilizing him, causing disorientation and loss of balance. He will probably fall to the ground, feeling weak and dazed for some minutes afterward. Full recovery in this instance takes about 10-15 minutes. The "Talon 250" is effective through 1/2inch of clothing.

TALON 250 STUN GUN: ï¿½95 (Batteries included)

Well, the harness lengths are an integral part of the networks.

The bandpass cavities will look like 50 ohms in and out when
adjusted properly, and will maintain a flat line SWR on their
side of the network if the string is terminated in the characteristic
impedance of the line at the transmitter and at the antenna Tee.
So cable lengths aren't critical on the pass side, *except for one*
(see below), and you just need to peak the series pass cavities for
best passthru of your transmitted signal.

A reject notch cavity will look like a virtual short at some
frequency, *at its connector*. This is in shunt with the transmission
line. At some cable length from that connector, it can look like an
open or some intermediate impedance due to the standing wave it generates
on the line. This causes the cavity tuning to interact between the cans,
and can cause problems at the combiner Tee if the cable lengths aren't
arranged properly. Thus cable lengths are an integral part of the network
response.

Now a convienent way, not necessrily the only way, to deal with
this is to separate each receiver notch cavity from the adjacent
cavity by an electrical halfwave of cable, at the *transmit* frequency.
Since impedance repeats at halfwave multiples, this overlays the
notches of all the cavities at the first cavity connector when the
string is tuned to that electrical halfwave frequency. And the cable
from the first notch cavity to the combiner Tee should be an electrical
quarterwave at the transmit frequency. That'll make the line to the
receiver look like an open circuit to transmit frequency energy at the
Tee because a quarterwave inverts impedances, turning a virtual short
into a virtual open. The transmit energy then only sees the antenna
impedance as a load. That's exactly what you want it to see.

When receiving a signal, the notch cavities will look like high
shunt impedances on the line, and hopefully won't contribute
any significant loss to the received signal (if they do, you

have a cavity with degraded Q which you need to repair). But the received signal will divide at the Tee, some going toward the receiver, and some going toward the transmitter. That's a loss of signal to the receiver.

Now the transmit pass cavities are in series with the transmit line, and should, if their Q is good, look like a high impedance to the received signal, reflecting it back toward the Tee. It must arrive back there in phase so that it can add constructively rather than destructively, so the cable length from the Tee to the first pass cavity should be an electrical halfwave at the *receiving* frequency. The received signal going down and back will arrive back at the Tee in phase and will sum with the received signal.

Now you can use other combinations of cable lengths and compensate by tuning the cavities differently, but it will be the duplexer from hell to get aligned properly for lowest loss. When tuning the duplexer, all ports have to be terminated in the correct impedance. I generally peak the transmit pass filters first, with the antenna and receiver ports terminated with 50 ohm loads. I'm looking for maximum output at the antenna termination. Then I tune the receive notch filters, looking for minimum power at the receiver load (as tuning becomes closer, a thru pad and a receiver with an S meter can be used as an indicator). This will rough tune the duplexer.

Final tuning of the duplexer is best done with a network analyzer or a spectrum analyzer with a tracking generator (I prefer the latter since it lets you *see* the duplexer response). All of the adjustments will interact to a degree thanks to imperfections in phasing, so you just go back and forth tweaking here and there until you've got it tuned as best you can. You should have no more than 0.5 db of insertion loss on the receive side with a high Q notch string and a high Q pass string. You may have a couple of dbs of loss on the transmit side through the pass cavities. That's no big whoop, just turn up the transmitter PA to compensate.

Now when you install the duplexer, you'll find that performance is degraded from what you had while bench tuning it. That's because the transmitter doesn't look like a perfect 50 ohm termination, the antenna doesn't look like a perfect 50 ohm termination, and the receiver doesn't look like a perfect 50 ohm termination. With all three ports mismatched, it is anybody's guess what the response of the duplexer will be. The only thing we can be sure of is that it won't be *better* than what we saw on the bench.

What to do? There are two schools of thought on this. One approach is the absorb the mismatches into the duplexer network by retweaking the cavity nearest the mismatch. The purist school of thought says to correct the mismatches with external networks. In either case, you need a weak signal source and a SINAD meter on the repeater receiver. The goal is to reduce the desense on the weak signal

as much as possible by adjustments to either the duplexer, or
the external networks if you are a purist. The goal is to reduce
desense to zero, IE there is no difference in the SINAD meter
reading between repeater transmitter on or off, while at the same
time achieving best receiver sensitivity.

As an example of when an external network is warranted, I helped
a fellow who had horribly poor sensitivity and lots of desense
in his repeater. The duplexer had been bench tuned perfectly,
but in the system it worked horribly. Upon inspection, I discovered
he was feeding the antenna with 75 ohm CATV hardline. That mismatch
was screwing up the duplexer tuning. Adding a 75 ohm to 50 ohm
matching network cleared things up immediately. OTOH, a mismatch
at the transmit or receive port is usually best just absorbed into
the tuning of the nearest cavity if it can't be easily corrected
by tweaking the transmitter or receiver networks.

You can easily get hopelessly lost in the tuning process if you
don't *write things down*. Record every adjustment and every reading
as you do them. That way you have a chance of getting back where
you were if things start going awry. Tuning up a duplexer requires
patience and freedom from distractions.

w8jitom@aol.com writes:

>>The arcing visible in the pictures could just as easily been caused
>>by a mistuned amplifier running into a high VSWR.

I have to disagree. Tom, I have a SX-42 receiver here with damaged
RF stage components -- arced bandswitches, burnt resistors, and
defective 6AG5 pentode tubes.

A few years back I was monitoring WWV during an intense solar
storm. Imagine my horror when a bandswitch section began arcing
over, carbonizing the wafer! IMHO this was caused by photon
bombardment. I will sell you a picture of the bandswitch damage
for your webpage, if you are interested.

Later that year, I had a long wire connected during an electrical storm.
Again, the wafer switches began arcing over. IMHO this was caused
by parasitic oscillations in the 6AG5 pentodes induced by the high
voltage transients present at the antenna terminals.

Hallicrafters used resistive loaded rf chokes in the screen supplies,
and 15 ohm resistors in the grid and plate leads. I suspect had they
used nichrome wire, these problems would have been avoided. The
last straw was when the parasitics took out a mica plate bypass
capacitor -- destroying the 1.2k plate resistor.

Tom, what is the saturated cathode current of a 6AG5? Folks, why
won't Tom answer this question?

One of the RF stages had damaged screen resistors as well and a
destroyed 6AG5. I will smash open the tube and sell you pictures
if you are interested.

Imagine my horror when I discovered sharp dips across the entire
spectrum with my Millen griddipper (The receiver covers 540-kHz to
108-MHz) while probing the RF compartments!!

I have one final question.... How does Rich measure the LOADED
Q of a PA tank circuit using a grid dipper? I see many comments
regarding the use of his nichrome parasitic suppressors. The most
common comment is "the vernier tuning effect" after the suppressors
are installed. This would seem to indicate the loaded Q of the HF
tank circuit is being compromised by the addition of the suppressors.
Isn't the loaded Q value an important parameter in designing a
tank circuit for optimum impedance transformation?

I'd suggest *that* was the result of photon bombardment. Probably
about 2 MHz photons. :-)

>that fact, but it's true.

At the risk of repeating myself, let me say that there appears to be some confusion (on both sides) as to what is the product here. The product is the information in 80 years of QST. It is not a Windows browser that happens to be included on the disk to display it. There should be nothing about the data which is platform specific. If there is, then that is a seriously flawed decision.

Windows has only been around a short time, and may be gone (as we know it) in a further short time (see my note about the Java VM and Microsoft's announced plans for their next generation GUI). The data in those 80 years of QST remains valuable. It should remain accessable regardless of the underlying operating system used, *if* it contains no Windows dependencies. That would fatally flaw the product.

There is an ISO standard for cross platform structuring of data on CDROMs. There are several image formats which are quasi-standard across platforms. And comma delimited form is the most basic way of formatting cross platform data for databases. As long as these are followed, the data remains accessable.

It would be better, of course, if a higher level standard of data commonality were chosen, such as the forementioned HTML, so that browsing could be transparent across platforms (and networks). And I could certainly recomend an image format better than TIFF, but those are minor issues. As long as we can read and display the data with any CDROM equipped platform using available native tools, it is still usable.

681. 6m duplexers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-19 00:00:00 UTC
From: tim_hynde <tim_hynde@idecc.com>
Message-ID: <32E2A954.2203@idecc.com>
Source record: 98531

I finally have enough 6m FM "stuff" to put a machine on the air. Can anyone advise my options on duplexers. I could go remote site for the TX but prefer to keep it all at one location.

I've priced new ones, I could take a second mortgage on my home but I thought perhaps building some would be more economical.

Can I use less (as far as the duplexer is concerned) if I go with a 1Mhz split as apposed to .500 Mhz.

73, Tim

682. 455Khz Resonator - What is it

Hello all,

First of all, thank you for reading my message.

I have aquired a Harris series 450 car telephone order number ct 450. It has most of the crystals in it for the 450 mobile phone band. It is missing the duplexer.

I am wondering what people have done with these radios. One person told me that it can be used as a full duplex mobile radio and can be moved down to the 440 frequency range. I was just wondering if this would be a good radio to make a repeater out of, and if so, where can I get documents on the radio and where can I find a duplexer that will fit in the radio.

If anyone has any information that would be helpful, I would really appreciate a response.

>
> If Dave had not corrected you in public about the real cause of his
> TL-922's arcing (a bad lightning arrestor), you likely would have posted a
> picture of the capacitor on your web page and slammed Kenwood ...snip...

Dave contacted me privately before the public announcement. About 4 years ago, in my 8169 amplifier, I experienced a similar tank arc which was caused by an arc in my 160m Hertz antenna's L-network tuner, 100 feet down the coax feedline, out in the back yard.

According to Dave, he bought the TL-922 used. Dave said he noticed there were arc marks on the tuning capacitor before he put the TL-922 into service.
According to QST Staffer Dave Newkirk, the TL-922 at W1AW had a tune capacitor that became so badly erroded from mysterious arcing, the tune capacitor was replaced with a new unit. At Dave's request, I sent suppressor retrofit kit s/n 293 (5/23/89) to to the folks in charge of W1AW. The factory-stock suppressors were reportedly replaced with low VHF-Q suppressors. According to my records, the ARRL paid for retrofit kit s/n 293.

The burned bandswitch shown in "Parasitics Revisited" (9/90, 10/90 QST magazine) was removed from a TL-922. The ham who owned this amplifier lives in Phoenix, AZ. No lightning arrestor was connected to the TL-922. The burned bandswitch was replaced with a new unit. The beautiful silver plated factory-suppressors were replaced with ugly, low VHF Q suppressors. I have spoken with a number of TL-922 owners who have had also had the 10m and 15m contacts burn up on the bandswitch.

> More recently you declared all amateur PA's poorly designed because they
> had no rheostats like commercial transmitters, and declared no proper
> engineer would purchase a transmitter without one. Several people rebuked
> you for saying that, one of whom is a top notch engineer for a large
> commercial BC transmitter manufacturer.

W6TG said that all ten of the commercial amplifiers he takes care of have continuously adjustable control of the filament voltage.
Unless my news server missed a post, the 'top notch engineer' failed to answer the question about the peak inrush current through the rheostat brushes, failed to explain why they were using carbon rheostat brushes instead of graphite rheostat brushes, and failed to say whether or not the

amplifiers with the high rheostat-failure rates used a step-start circuit.
.
As I recall, the Collins KWS-1, 208-U... general coverage amplifiers, and 30S-1 amplifier use a rheostat to adjust filament voltage. I have never heard of a rheostat failure in one of them. // Was the 'top notch engineer' title awarded by a recognized amplifier expert? If so, who recognized this expert? Based on my experiences, knowledgeable engineers do not stonewall questions.

> Now you've moved on to the AL-80 or something with more Richard L.
> Measures picture "evidence". ...snip...

There is no 'or something', Mr. Rauch. According to the AL80A's owner, Rick May, the original bandswitch burned up, and the first replacement bandswitch burned up. He is currently using bandswitch #3, which is not arcing. However, Rick said he is no longer using the AL-80's original VHF parasitic suppressor. The photographs of the original and the replacement AL-80A bandswitches with missing/vapourized contacts are available at:
http://www.vcnet.com/measures/
See Figure 15.
Rick's e-mail address is listed.
Seems like Mr. Rauch is suggesting that my two AL-80A bandswitch photographs are somewhat less than authentic---i.e., fake..
Hmmm.
OJ swore that the picture evidence of him wearing size 12 Bruno Magli shoes is a fake. Tom: In your expert opinion, are the news photographers, who subsequently produced 30 other photographs of OJ wearing size 12 Bruno Maglis, slamming OJ? IMO, prevaricators slam themselves. Is impeachment slamming? A well-known teacher reportedly said that everything that defiles a man comes out of his own mouth.

A while back, you groused about a lack of discussing technical issues on this thread. How about discussing Wes Stewart's VHF Rp measurements? VHF Rp is a determiner in VHF voltage gain, so discussing it seems appropriate.

BTW, Tom, what are the values of Rs and Ls in your new suppressor design that will exhibit equal to or better VHF characteristics than any of the suppressors Wes tested?

Haven't built one, but talked to a guy on 160 the other nite who
had one from this outfit:

http://users.aol.com/rfelectron/rfelect.htm

They sell kits, 500 & 1000 watt solid state. Not legal limit but...
A 65 amp power supply to run it might be another project in itself.

689. Solid State amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-19 00:00:00 UTC
From: Randy Alexander <alexan@teleport.com>
Message-ID: <32E29735.3FA9@teleport.com>
Source record: 98539

I am interested in building a legal limit solid state amp. On perusal of a few catologs the max I see is 1kw. I do have reference material from Motorola. I also have kit information from a couple of houses. It concerns me that I don't find any commercial units. I would like to hear from anyone out there who has done this. What kind of problems came up. The obvious ones that I see are the high currents in the filters transformers and relays. How were those handled? TNX AB7QR

That would be a dipole?
I take it you are referring to me in your post when you say I
> failed to answer the question about the peak inrush current through the rheostat
>brushes and failed to say whether or not the
>amplifiers with the high rheostat-failure rates used a step-start circuit
But in the original post I said that low-capacity transformers were
used that limited the inrush current to twice operating. No
step-start would be needed since the voltage comes up gradually as the
current drops. (As an aside, I experimented with the use of
thermistors as inrush current limiting devices. They were widely used
in many older TV sets. They worked quite well for me but their
lifetime was limited--which kept TV repairmen in business.)
>failed to explain why they were using carbon rheostat brushes
>instead of graphite rheostat brushes, .
Well, I did fail to explain that but did, instead, point out that we
have noted a great deal of unexplained brush failure in filament
circuits when the same RMS current causes no failure in a commutating
supply transformer primary, e.g., a bias supply. (We never changed
the brush type or the filament control mechanism in the production
transmitter because it was out of production when we started seeing
the problem.) Forrest Cummings, the designer, may have been
influenced in his selection of filament adjust mechanisms by the
transmitter designs you mention below.
> As I recall, the Collins KWS-1, 208-U... general coverage amplifiers, and
>30S-1 amplifier use a rheostat to adjust filament voltage. I have never
>heard of a rheostat failure in one of them.
Well, we got two separate issues here. The 30S-1 used a 4CX1000A
which had a strontium-oxide coated cathode while the KWS-1 used
(originally) 4X150A's. The 4CX1000A tube was still a new item when
the 30S-1 was designed and the tube manufacturer had not been
able--has never been able--to get more than 6000 hours out of that
type cathode when operated at full current (big proviso). The tube
was also oriented at an angle rather than mounted vertically as in the
KWS-1. Good heater/cathode temperature control was considered
essential to maximize the life expectancy when these amplifiers were
used in commercial service (higher duty cycle). High cathode
temperature could lead to oxide flaking and internal shorts. Because
the filament transformer was located in a difficult-to-access area, no
taps were provided and yet the amplifier had to operate over a wide
range of voltages. That's why the heater control was incorporated.
The choice of a rheostat was made, I assume, because of cost and size.

The second issue is whether there have been rheostat failures in these Collins transmitters with heater/cathode tubes. And I can't comment on that except from personal experience. I've owned two 30S-1's and one KWS-1 and never had any problem. The low-capacity filament transformer of the 30S-1 limited the surge current of the heater--just as it did in the filaments of the more-recently designed MW transmitter I used as an example. You realize, of course, that the fact I never had any failures doesn't mean there weren't any. I can tell you, however, that rheostat failures on other broadcast transmitters (the Gates FM-20H, for example) were quite common and that we haven't used them in a new commercial design for twenty years.

I hope this post clarifies any questions about my previous post.

Hello all,

First of all, thank you for reading my message.

I have aquired a Harris series 450 car telephone order number ct 450. It has most of the crystals in it for the 450 mobile phone band. It is missing the duplexer.

I am wondering what people have done with these radios. One person told me that it can be used as a full duplex mobile radio and can be moved down to the 440 frequency range. I was just wondering if this would be a good radio to make a repeater out of, and if so, where can I get documents on the radio and where can I find a duplexer that will fit in the radio.

If anyone has any information that would be helpful, I would really appreciate a response.

TURN $5.00 INTO $50,000 NO SWEAT!!!!

THIS IS THE SIMPLEST WAY I KNOW OF TO MAKE CASH!!!

Hello! Would you like to make thousands of dollars from just a few, legally, with NO CATCH? OF COURSE!! Please take a few minutes to read this article, it will change your life, just as it did to me. It's easy and true. You can make up toor over $50,000 in just 4 - 6 weeks, maybe sooner!

I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM!!

Here we go, a little while back I was browsing these newsgroups just as you are now, and I came across an article similar to this that said you could make thousands of dollars within weeks for an initial investment of $5.00! First thing I thought was " SCAM ". Anyway, it said that you send $1.00 to each of the 5 names and addresses stated in the article. You then place your own name and address on the list at the number 5 position, and post the article in at least 200 newsgroups. THERE ARE THOUSAND OF NEWSGROUPS!!! NO catch, that was it. OH, and wait for our money to start flowing through the mailbox. There is nothing to loose except $5.00 and 5 stamps.

Well guess What!... within 7 days,I started getting money in the mail. I was shocked! I still figured it would end soon, and I didn't give it another thought. But the money just kept coming in. My first week I made $20.00-30.00 dollars. That already at least quadrupled my initial investment. By the end of the second week I had well over $1000.00!!!!!!In the third week I had over $10,000.00 and it was still coming. This is know my forth week and I have made a total of just over $42,000.00 and it still comes. That is all in CASH. Certainly worth

the initial $5.00.

Let me tell you how this works and most importantly WHY. Also, make sure you PRINT a copy of this article NOW so you can refer to it easily. There are three easy steps:

STEP 1

Get 5 separate pieces of paper and write the following statement on each piece:

"PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE NUMBER (their number on the list below)."

now get 5 $1.00 bills and place one inside each of the 5 pieces of paper sothe bill will not be seen through the envelope to prevent thievery. Next, place one paper with the money in each of the 5 envelopes and seal them. By this you are creating a service. THIS IS PERFECTLY LEGAL.

NOW MAIL ALL 5 ENVELOPES TO THE FOLLOWING:

1. M.V. Harrington P.O. Box 8751, Portland, OR 97207

2. Jerome Sanders 110 Orange Dr., San Luis Obispo, CA 93405

3. Nathan Gonzales 7180 Hurley Dr., Beaumont, TX 77708

4. B.M. Mahoney 34 Tamara CT., Melville, NY 11746

5. M. Kruze 1423 N. Leavitt St., #2F, Chicago, IL 60622

STEP 2

Now take the #1 name off of the list that you see above, move the other 4 names up a space (5 becomes 4, 4 becomes 3, 3 becomes 2, 2 becomes 1) and asdd YOUR NAME as number 5 on list.

STEP 3

Change anything you need to but keep this article as close to the same as possible. Now post your article to at least 200 newsgroupes. (I think there is close to 18,000 newsgroups). All you NEED is 200, but remember, the more you post the more CASH YOU MAKE!!!

Here is how to post to a newsgroup:

FOR NETSCAPE:

1. Click on any newsgroup loke normal. Then click on 'TO NEWS' which

is in the top left corner of the newsgroup tool bar.

This will bring up the message box.

2. Fill in the Subject with a title that stands out, like theone I

used.

3. Now go to the message part of the box and retype this letter exactly

as it is here, except with your few changes.

4. When your done typing in the WHOLE letter, click on 'FILE' above the

send button. Then on 'SAVE AS' DO NOT SEND YOUR POSTING UNTIL YOU SAVE

IT. THis is so you do not have to type the letter again and again.:)

5. Now that you have saved the letter, go a head and send your first

copy. (click the send button in the top corner)

6. THIS IS WHERE YOU POST ALL 200+!!! OK, go to ANY newsgroup article

abd click the ' TO NEWS' button again. Type in your eyecatching,

interesting subject in the SUBJECT BOX then go to the body part of the

messeage and leave your cursor there. NOW click on 'ATTACHMENT' which

is right below the SUBJECT BOX. Click on attach file, then find your

posting, whatever you saved it as, then click OK. If you did this right

you should see your filename in the attachment box and it will be shaded

green.

NOW POST AWAY

THATS IT

All you have to do is jump to different newsgroups and post away,after

you get the hang of it it should take you about 20 seconds a newsgroup.

***** REMEMBER THE MORE NEWSGROUPS YOU POST IN THE MORE MONEY YOU MAKE

***** AT LEAST 200

You will recieve money in you mailbox from around the world.

NOW THE WHY PART

Out of 200 postings, say you only recieve 5 replies (very very

unlikely) SO then you make $5.00 with your name at #5 on the letter.

NOW, each of the 5 persons who sent you $1.00 make a minimum 200

postings, each with yor name at #4 and only 5 persons respond to each of

the original 5,. that is another $25.00 for you, now those 25 each make 200 postings with your name at #3 and only recieve 5 replies each, you will bring in an additional $125.00, thise 125 persons turn around and 200 withyour name at #2 and only recieve 5 replies each, you will make and additional $625.00!!!!OK now here is the fun part, Each of those 625 persons post 200 with your name at #1 and they each only recieve 5 replies. YOU HAVE JUST MADE $3,125.00 That is only with 5 responses. Average is 20 - 30. Lets say each time you get a 15 person response. Here is what YOU will make:

#5 $15.00

#4 $225.00

#3 $3,375.00

#2 $50,625.00

#1 $759,375.00

When your name is no longer on the list you can find the latest posting and start over again.

Thousands of people all over the world come onto the internet everyday. This is the FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT A LITTLE BIT OF TIME!!!!!!!!!!

Thanks

I've heard of people using shorted and open lengths of hardline in
place of a duplexer. A local 2m repeater that I occasionally use
has some tuned hardline stubs in place as a notch filter to kill a
pager signal that gets into the front end. This is worth a try...

I caught some flak on this statement, so I did some research. What follows is an explanation of the DOS/Windows-kinship written by a more knowledgeable person than yours truly. For those who are interested in reading the explanation, the format is html, so copy the text below the line, paste it into an html WP in html mode, switch to edit mode, and it should be readable. You can also read it with Netscape Navigator.

By Andrew
Schulman

According to Microsoft, "Windows 95 isn't a layer
on top of MS-DOS. It is a complete operating system with 32-bit,
protected-mode subsystems to keep your PCs running. If an errant
application or component goes down everything continues to run."
("

Windows 95 Fact Sheet for Information System
Professionals.")

Is it true that Windows 95 (Win95), unlike Windows
3.x, isn't a layer on top of DOS? Is it true that it's robust enough
to keep going in the face of buggy programs?

Certainly, these claims aren't merely advertising hype from
Microsoft, because much of the PC industry -- power users,
developers, IS professionals, and computer journalists -- backs up
Microsoft's claims. That so much of the industry is heavily invested
in these claims makes them worth examining.

DOS is dead; Long live DOS

As one example,
Windows Magazine (December 1994) enthuses that
"Windows no longer has to hand off to DOS or bypass DOS or work with
DOS or do anything with DOS -- because there is no DOS," and a

letter in the same issue gushes, "DOS is
dead-- hurray for WINDOWS Magazine! ... I recently tried a sample
copy of another Windows publication and their article on Windows 95
was filled with incorrect information, including the misconception
that in Windows 95, DOS boots up first and then calls Windows.

Needless to say, I will never read that magazine again." And while Microsoft itself is careful never to claim that Win95 is some sort of "NT Lite," the company has definitely given developers and computer journalists the impression that Win95 is architecturally closer to NT than to the old Windows/DOS combination. Even Charles Petzold, probably the world's leading authority on Windows programming, has written that "While Windows 95 was originally going to run on top of DOS 7.0, the architecture was revised to replace DOS entirely. Thus, Windows 95 is closer to Windows NT than any previous version of Windows" (PC Magazine, January 24, 1995).

Another good example, perhaps, is O'Reilly's own book, Networking Personal Computers with TCP/IP. The chapter on Win95 TCP/IP opens with: "The newest generation of Windows is not dependent on DOS.... Windows 95 is not simply a new version of Windows; it is an entirely new operating system." The book goes on to say that Win95 is a "fully integrated operating system. Windows 95 does not depend on DOS; it replaces it. The PC boots directly into Windows 95.... The kernel is 32-bit protected mode code, which should greatly enhance reliability.... Only modules that require backward compatibility with Windows 3.1 use 16-bit code."

The PC industry -- even a company such as O'Reilly with every reason to be skeptical of Microsoft's claims -- seems almost desperate to believe that DOS is dead, and that Win95 isn't merely a very compelling upgrade -- Windows 4.0, combined with MS-DOS 7.0 -- but a brand new operating system, similar in design to NT, redesigned from the ground up, which ushers in a new era in personal computing. Major purchasing/development/deployment decisions are being made based on these beliefs.

Yet, its difficult to know what's really being claimed for Win95. While on the one hand Microsofts Win95 "World Tour" displayed the slogan "NO MS-DOS!" (see Computer Reseller News, June 5, 1995), at the same time the Microsoft Windows 95 Resource Kit contains a short section, "Technical Notes on MS-DOS Components in Windows 95" (pp. 560-561), which directly contradicts this assertion. The section starts off by acknowledging that "Many users have wondered whether Windows 95 contains MS-DOS code, and if so, whether that means that Windows 95 is somehow built on top of MS-DOS." The section goes on to list over a dozen functions which Windows 95 handles by calling MS-DOS. No MS-DOS?

Microsoft merely states that "Functions implemented in this manner ensure backwards compatibility with existing real-mode software, such as the Novell NetWare client." This is very odd. Microsoft's attitude in its resource kit -- "gee, we could really get rid of DOS if it weren't for this wooden leg called

NetWare" -- hardly matches the claims in its advertising that DOS is already gone.
What does it mean to explain why DOS is present (even if the explanation given isn't a very convincing one -- for one thing, software such as NetWare isn't interested in some of the calls such as Get Date and Get Time that Win95 passes down to DOS), when the company widely broadcasts claims that DOS is already gone?

This is typical of the sloppy thinking around this issue. The more you look at them, what at first appear to be statements on Win95's architecture turn out to be a feel-good exercises. Back in February 1994, the Microsoft Systems Journal claimed that Windows no longer can be likened to a fancy paint job on an old MS-DOS Yugo. "Because the entire operating system is freshly designed from the ground up, you now have killer features such as threads, memory-mapped files, and asynch I/O." Move ahead to October 1994, and this same statement appears in Dave Edson's oddly titled book, Dave's Book of Top Ten Lists for Great Windows Programming, except now the entire operating system is merely most of the operating system (p. 251). Aside from the amusing sight of Microsoft employees describing MS-DOS -- the most successful software product ever, and the foundation for Microsoft's fortunes and success -- as a Yugo, you have to wonder about the apparent ease with which these phrases such as "freshly designed from the ground up" are thrown around.

So whats the truth here?

My Una
uthorized
Windows 95 (IDG Books, 1994) showed in detail -- perhaps an absurd amount of detail -- that Win95 still relies on DOS. DOS is part of Win95, not simply a convenient place from which to boot, nor simply for "compatibility." The system still has MS-DOS at its core.

As one example, every Windows program, even the newest Win32 program, requires a DOS data structure, called the Program Segment Prefix (PSP), which the system allocates in conventional memory, and initializes with a DOS call (INT 21h function 55h). And every program that exits, whether DOS, Win16, or Win32, calls the DOS Terminate Process function (INT 21h function 4Ch). Win95 most certainly does sit on top of DOS, albeit a copy of DOS that comes in the same package.

Now, it is true that Win95 runs DOS in Virtual-8086 mode. This means that Win95 runs DOS, rather than the other way around. But exactly the same could be said of Windows 3.x 386 Enhanced mode. And its true that Win95 provides 32-bit file access that bypasses the file I/O code in DOS. But the same could be said of Windows for Workgroups 3.11. Win95 relates to DOS in the same way that Windows 3.x Enhanced mode has always related to DOS. Win95

continues to use DOS for many non-file operations, including getting the current date and time, getting and setting the current drive, managing PSPs, and so on. (One important difference, however, is that Win95 provides memory-mapped file I/O: this new feature is a good example of what bypassing DOS really looks like.)

So, to whatever extent you can say that Win95 is not a layer on DOS, you could say the exact same of Workgroups 3.11. Yet, Microsoft spokesmen today trash that product as hopelessly lame. Check out the interview with Microsoft VP Brad Silverberg in Adrian King's Inside Windows 95: "When I have to go back to the Windows for Workgroups machine, its like, 'This is the old stuff. How did I ever use this? How did I ever like it?'" (p. 415). Will we one day be hearing of how Win95 is a joke? Remember, it wasn't so long ago that Microsoft claimed that Windows 3.x was not a mere "operating environment" layer on DOS, but a full-blown operating system, part of an "integrated whole" with DOS. Now it turns out according to Microsoft to have been a mere layer, after all.

Perhaps its worth spending some time up front anticipating how Microsoft, in its next fit of "creative destruction," will describe Win95 a few years from now. A Microsoft spokesperson seeking to encourage you to jump on the Windows 97 bandwagon might, for example, note that Win95 obviously rests on top of DOS, and if you doubted it, might point out a ridiculously easy way to see that this is so: If Win95 isn't a layer on top of DOS, then obviously overwriting DOS in memory should have no effect on the running of Windows itself. Oh, it might make it impossible to run DOS programs, but clearly a DOS-free Windows would be able to run Windows programs even in the case of a corrupted in-memory DOS.

Well, it turns out that overwriting DOS in memory kills off all of Win95 -- not just the DOS box. For example, the following C code brands the first two bytes of the DOS INT 21h handler with the number of the Beast thereby crashing the system on the next DOS call.

This next DOS call may come from a Win16 or even from a Win32 program.

That trashing DOS trashes all of Win95 shows how ludicrous is the idea that DOS is gone from Win95. So where does this idea come from? Is it just wishful thinking? Certainly it's not based on even a cursory examination of the product. That overwriting MS-DOS from a DOS program brings down the entire system means that Win95 can't survive without working DOS code underneath it -- even if you never run a single DOS program. DOS is gone from Win95 in only the most superficial and meaningless sense that it's also gone from Windows 3.x Enhanced mode.

Win95 is an excellent product, but it's crucial that the industry get its expectations in line with the realities of

the product. Otherwise, Microsoft and those who repeat its slogans could face a nasty backlash from those who believed they were getting NT Lite, only to find they have nothing more -- though also nothing less -- than Windows 4.0 lashed together with MS-DOS 7.0.

Return to Windows 95

Do you have access to high voltage power supplies and filament
supplies, or do you need that, too (making it a TWTA- A for
amplifier)? Many of the above tubes have different beam voltages, some
might have depressed collectors, etc. That is a MAJOR factor.

Are you looking for new tubes/TWTAs, or used but working? I can get
tubes from a variety of sources, but only new.

The HTX-212 will not X-mit out of band, with the exception of MARS/CAP.
Why do you need to X-mit out of band anyway?

703. 150MHz VCO w/low phase noise?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-20 00:00:00 UTC
From: tomb@lsid.hp.com
Message-ID: <5c0f10$l93@hpcvsnz.cv.hp.com>
Source record: 98303

I'd appreciate pointers to designs of low phase noise VCOs
in the 150MHz range, with a control range of 5MHz or so.
Lower control range (down to 1MHz or so) with band selection
thru diodes would also be OK. Would especially like pointers
to articles that discuss the designs in some detail, not just
say, "build it like this and it will be fine." Practical as
well as theoretical info would be helpful: things like,
"this series of varicap diode is especially good," as well
as, "the varicap diode should have these characteristics
for optimal performance."

Steve - Solid State Design has a circuit for a DSB VXO 2m transmitter. You could remove the bal modulator and key the PA stage and operate it as a CW rig. However the circuit is a little complicated, so you could start from circuits in the ARRL h/book.

If you want a VXO, use a fundamental frequency crystal (say 1/8 or 1/9 the transmit freq - ie 16 or 18 MHz) and multiply. If you just want a fixed frequency, an overtone crystal at a higher frequency will require fewer multiplication stages. I used a 36.025 MHz crystal successfully. For the xtal osc, I used the circuit in Solid State Design for the 10 metre Universal transmitter. This worked OK.

Then build up one or two multipliers, key the final stage, and you have a rig. You might want to make up a band pass filter as well. I've been heard 5-10km away with about 10-30 milliwatts into ordinary antennas. However my experiments with 500mW of SSB from hilltops show that distances of 100-300km should be possible.

If Dave contacted you privately before the public announcement, why did
you go ahead announce the arcing was caused by a parasitic? If you
experienced an arc in your tuner that caused your PA's tank capacitor to
arc, why didn't you ever indicate or admit an arcing problem could be load
related?

In article <measures-3010961224430001@port20.vcnet.com>,
measures@mail.vcnet.com (R. L. Measures) writes:

>was due to a largely-unloaded VHF parasitic oscillation.

Three times you indicted the 922 arcing had to be a parasitic. It was your opinion. It was your conclusion.

You posted that conclusion knowing full well that it could be a load problem, you admit you did so **after** Dave indicated in E-mail it was an arcing lightning arrestor.

In article <measures-ya02408000R1901971257220001@news.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:

You intentionally omitted evidence you discovered four years earlier that contradicts your public posture that parasitics are the only cause of tank circuit arcing.

You misled us about the AL-1500 that you NOW admit was not even an AL-1500. (Marvin said there is no way you didn't know that from the very beginning, he said he was very clear about what the PA was.) You did the same with your claims about conversations with Eimac.

Rich, how can anyone trust you?

My call sign is MY business OFF the air. So is yours. If you don't like that, tough tetrodes!

Since when is a ham callsign required to post in usenet?

As I have said to someone here before, I do not give my callsign off the air.

If you need a callsign, my internet "callsign" appears at the top of my messages. Deal with it.

>marine band instead of buying another radio.

In addition to being very illegal, there is only one modification that
will work, legally or otherwise, to make the 212 go out of band
transmit.

Here it goes. Take a clean work surface, and cover it with something
to ensure that the screws do not get lost.

Take the 212, and set it face down on the surface.

Take a type accepted radio, for the band you need, and set it, face
up, on the back of the 212.

Take duct tape, and tape liberally.

There you have it!

Technical specifications for the 2SK897

Function : POWER STAGES (VERTICAL MOSFET)

Polarity : N-MOSFET ENHANCEMENT

Drain-source voltage [VDS Max] : 550 V

Gate-source voltage [VGS Max] : 20 V

Drain current, dc [ID Max] : 4 A

Total power dissipation [Ptot Max] : 40 W

Zero-gate-voltage drain current [IDSS Max] : 560 ΅A

PinOut : 1= G , 2=D , 3=S

Check out http://www.tds-net.com/pages/us/discrete.htm

and find specification and image of transistor

Sorry, for mistake with search data on 2SK897. Here's data on the
2SK879:

Function : FET

Polarity : N-FET

Material : SILICON

Drain-gate voltage [VDG Max] : 50 V

Static gate current [IG Max] : 10 mA

Total power dissipation [Ptot Max] : 100 mW

Zero-gate-voltage drain current [IDSS Min] : 300 ΜA

Zero-gate-voltage drain current [IDSS Max] : 6,5 mA

PinOut : 1= D , 2=S , 3=G

Victor

I got one called Scoper from Shareware.com (you can download it from and
simtelnet mirror in the win3/sounds/ directory.) It is a scope and
spectrum analyzer. It doesn't have that many options, but works fine for
me! You just put the input into your mic jack on the soundblaster. KB0MMU

>will work, but just throw the rest away.

Greetings. Say, for the uninformed, how serious are the problems with interference from household Microwave ovens (which happen to be right there in the middle of the 2.45GHz)? How accurate is the frequency of the $35 magnetron? Does it drift? (since the drive depends on the household power quite a bit) Anything else you can add on this?

Take care.

P.S. Just fixed a nice Kenmore with a new HV diode... and another GE spacemaker (nice one) with a new door-interlock switch... because:

It seems to me that 'ARRL bashing' and questioning a questionable decision
is hardly in the same league.

How can you know that 'future CDs will be better' unless you are psychic?
If it happens, we may have to wait a while. The *Radio Amateur's Handbook*
published erronius PI-L formulae in the amplifier chapter for many years
before the problem was eventually fixed.

The new Handbook isn't much better. On page 13.13 there is a formula to
calculate the RF current in an amplifier's HV blocking cap. that appears to
be off by about 700%. .

At a hamfest yesterday I picked up a little 20 dollar 35 Watt solid state Class C 2 meter amp. Brought it home and this morning I was wondering what to do with it. Then I remembered the old Heath HW-30 (Twoer - Benton Harbor Lunch Box) I'd picked up a while back. Cleaned it up, re-capped it, disabled the regen receiver, connected the amp and fired it up on CW. It sounds good and I think I'm getting about 20 watts out of the amp. I had to go back and cathode key the driver to minimize the annoying backgwash tone (and emission) caused by the continuously running osc and driver.

I intend to use it for RS-10 and maybe RS-15. I need some rocks. Anyone have crystals in the 8103 - 8104 khz area?

At the risk of repeating *my*self, there is nothing platform-specific
about CCITT G4 TIFF files or comma-delimited database files. But I think
you overstate the case in saying that's the sole element of the product.
Clearly, the viewer, including the database engine as well as the image
viewer, is part of the product--the Mac users certainly seem to think
so, and so do I.

tim_hynde <tim_hynde@idecc.com> wrote:
: In the Epiphite 2 (80m SSB tranciever) I am building there is a call for
: a 455Khz Resonator. I understand 455Khz as an I.F and for the most part
: how that works but:

: The P.C board spacing appears larger than a standard 455Khz filter.
: Would someone please explain the difference between the resonator and
: the filter, if there is one?

The 455 KHz resonator is a ceramic device that has a low real
impedance at the centre frequency, in this case 455 KHz. They are
commonly used as the resonator for an oscillator, similar to using a
crystal.

They can also be used as crude single-pole bandpass filters, and
both the Toko and MuRata catalogues show them as being used in place of
a bypass capacitor in the emitters of IF amplifiers.

I gotta go.

Source record: 98375

I also <had> a Gap at one time, and experienced similar problems with shorted 80 mtr resonating caps. Eventually the whole antenna failed due to water incursion into the coax where it enters the base of the antenna. As it turns out, Gap did a poor job of deburring the hole where the coax passed through the antenna mast, which caused a hole to wear through the jacket of the cable, allowing water to enter.

I doscovered this when one day, while troubleshooting the antenna, I noticed water seeping out from the connector end of the antenna at the base of the antenna.

Eventually the Gap became nothing more for me than an end support for my tuned random dipole which worked considerably better than the gap.

Bottom line: The Gap is a reasonably decent antenna if you can't set up anything else, but it's considerably fragile in design and construction, relying on too many gimmicks and gadgets to resonate it across multiple bands.

For some good information, check out the books "Reflections" by Walt Maxwell, "Transmission Line Transformers" by Jerry Sevik, and the Antenna Book by Lew McCoy. Your opinions on antennas will change -- mine did!

If you have checked ftp://oak.oakland.edu/pub/hamradio/mods and found nothing, you're probably out of luck. Mods for Radio Shack radios are quite limited; that's why I never buy one.

If you ever need a Kenwood mod, e-mail me and I will do my best for you.

In reference to the other response you received, I do wish people would lighten up about type acceptance (and I mean the general public, not the FCC, which has more serious concerns than type acceptance to worry about.) I would certainly appreciate reading anyone's comments on this issue.

I also built one of the 60 kHz receivers from the '73' magazine articles. I found that the system was going into regeneration, by way of the 'tickler coil'. The regeneration appeared as an envelope, at a 120 Hz rate. It turned out that that the antenna was 'seeing' spikes at
this same rate, probably from some local source. The resultant regeneration was totally obscuring WWVB.

I then connected a frequency-selective voltmeter to a 30-foot wire antenna and clearly 'heard'
WWVB (when tuned for a 500 Hz offset). Next I connected the frequency-selective voltmeter to
the ferrite-core antenna (mine only had 400 or so turns). While I could hear WWVB, it was well below the noise. The level of the signal (+noise) was about 1 uV.

Here in Central Alabama, the NIST pub indicates that the signal strength should be between 100
and 500 uV/meter. After working through the equation for the voltage from a loop antenna, I think that it is the wrong antenna for a fixed-frequency application. (While the high inductance allows wide tuning with a variable capacitor, the small cross-sectional area limits
the signal voltage.) I have built a 22-turn air-wound loop antenna with a cross-sectional area of 0.5 meter and tuned it to 60 kHz with a (fairly-large) capacitance. I measure about 200 uV.

Hello Gary -
The ARRL Handbook says that the maximum safe grid current would be
undefined(!)
Plate current maximum is 400 mA
Remember that is an absolute maximum rating. You wouldn't want to run it
anywhere close to that high if you want good tube life.

Now the grid current is typically run at about 115 mA on a 3-500Z
and most other tubes in that class seem to have amaximum grid current
rating of around 120 mA so I sure wouldn't want to push it much beyond that!
To be on the safe side I would always run it a little lower than
what ARRL says is "typical operation."

That way you don't have to ever spring for new tubes!

w8pu@aol.com (W8PU) whistled a happy tune like:

|> http:\\www.geocities.com\CapeCanaveral\4573

Rectifier-amplifier tube
8AO socket connections (see below)
Heater 117 Volts at 0.9 Amps
Typical Use as a Class-A amplifier Plate (anode) supply 105 Volts
Grid bias -5.2V DC
Screen voltage 105 volts
Screen current 4-5.5 mA
Anode current 43 mA
Anode resistance 17000 ohms
Transconductance 5300 micro-mhos
Load resistance 4000 ohms
Power output = 0.85 watts
========================
Rectifier section:
Cathode = heater
Maximum AC voltage per anode = 117V AC
DC output current 75 mA

Same specs as a 117M7GT

Octal base connections are as follows:

1 = Kr
2 = H
3 = Pt
4 = G1
5 = G2
6 = Pr
7 = H
8 =Kt

Subscript "r" = Rectifier
Subscript "t" = Tetrode

I hope that this is helpful to you and to others that read it!
The 117L7 makes a great little one tube transmitter or audio
amplifier that can run off USA AC mains power without any power
transformer!

All the best - Bry

746. Replacement For 3SK78

Newsgroup: rec.radio.amateur.homebrew

From: David Ward <dave.ward@nt.com>
Message-ID: <32E3E895.7549@nt.com>
Source record: 98388

I recently purchased a old KDK 2025 2M FM rig at a flea market. After
I got it home I discovered the receiver section was almost deaf
(buyer beware). At any rate, as a learning exercise (and to get
a working unit) I would like to try to repair it. I suspect that
there is a problem with the RF amp. which precedes the mixer.
The RF amp consists of some bandpass filters and a 3SK78 FET.
I have two questions.

1. Can anyone suggest where I can get a replacement part or suggest
a substitute?

2. Is there any way with relatively simple test equipment I can
verify the device is defective, short of replacing it?

Thanks in advance.

Dave

>scott coburn X

The high inductance looks suspicious. If you used the specified number
of turns, it could be that the ferrite's properties are unsuitable at
60kHz (though this is hard to believe!)
Naturally the tuning capacitance required would be smaller.
To check it out, a signal generator (maybe even an audio oscillator
with extended range) should do the trick.

Shadowing from trees should not be a big factor - 60kHz is not a
'line-of-sight' frequency!

Good luck

748. Help with TR switch (was: Can I do this?)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-20 00:00:00 UTC
From: JOHNWHITE@gnn.com
Message-ID: <5c0789$oen@news-e2d.gnn.com>
Source record: 98390

I am constructing a 2M amp (less than 50 Watts out) and want to know if I can connect my PIN diode TR switch this way:

```
********************************** *******
* * * * *
* * ******* * * *
* * * * * *
******* *********** * ******* *
* HT * * RX TX * * * IN * *
* * * * * * * * *
* 5W * * PIN TR * * * AMP * *
* MAX * * Switch * * * * *
* * * * * * OUT * *
* * * * * ******* *
* * * ANT * * * *
******* *********** *************** *
* *
* *
***********************************
```

This setup uses only one PIN diode TR switch. Points of concern are:

1) Received RF is present at amp input during receive. Shouldn't be enough to turn on amp though. If it will turn the amp on; I can slightly attenuate the RF going to the amp input since I don't need all 5 Watts to drive the amp, thus reducing RX RF at the amp input to a low enough level.

2) 5 Watts max output from HT is present at RX connection of PIN diode TR switch during transmit. Assuming that it can handle 5 Watts RF there, that shouldn't be a problem.

3) Am I out of my mind?!

>I just had the pleasure of checking this out also. Yes, it does still
>work, and works great. Fantastic amount of info on the old gear.
>My compliments to the person responcible for the web site.

Greetings. I had a lot of fun browsing that site:

http://linux.cec.army.mil/hamradio/equipment/mi.html

... If you cheat a bit, and enter only part of the URL:
http://linux.cec.army.mil/hamradio/equipment/

You will noticed that on top of the 2-3MB of text that describes each item, there is also a 12MB directory (and TAR file :-) of schematics for same. I checked out a few of these and while they will never win a prize in clarity, they are more than enough to figure out what's going and what wire does what.

He is looking for images of as many of these items as possible, if you have something, please let him, NJ7P (bbeech@huachuca-emh8.army.mil) know you can help!

Take care.

P.S. Someone should to make a CD-ROM with that info on it...

Well, I made a jammer for the AM band long ago, you should be able
easily to get it to work at 27.

I used a 555 timer rich in harmonics as the driver and also
designed it so that it would sweep a portion of the AM band
using the vco input. Worked great. Since it was swept, it
didnt matter what station you listened to, it was annoying
to hear and eventually the radio would be turned off.

Somewhere to start, anyway.

tony

Source record: 98310

I'm really reluctant to touch this tar baby, but my curiosity has been aroused.

Why do VHF parasitics cause band switches to arc?

Is a VHF parasitic oscillation the only thing which can? (I assume so, since the presence of arcing bandswitches seems to be presented as adequate proof of VHF parasitics.)

Has anyone ever actually directly detected the presence of VHF oscillation (with a simple wavemeter, for example) in one of these amplifiers, then confirmed that the condition no longer exists after applying a fix?

Is this science or art?

For a couple of decades now I've used the vinegar-smelling stuff for all
sorts of electronics purposes, indoors and out, and never seen a trace of
corrosion. Has anyone else, or have you just heard (as I have) that it
causes corrosion?

A couple of very good and largely builder-oriented magazines devoted to QRP
are published by two of the QRP clubs. Contact

G-QRP Club
Rev. George Dobbs, G3RJV
498 Manchester Road
Rochdale, Lancs. OL11 3HE
England

and

NorCal QRP Club
Jim Cates
3241 Eastwood Rd.
Sacramento, CA 95821

I haven't seen the QRP-ARCI newsletter for some time, so don't know if it's
currently oriented more toward building or operating. Maybe someone else
can provide this information.

760. Designs for HF amplifiers using Svetlana 4CX1600B tetrode

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-21 00:00:00 UTC
From: bredenbo@iaonline.com
Message-ID: <32e472ae.30506362@news.iaonline.com>
Source record: 98313

Has anyone seen any designs or circuits for the Svetlana tetrode tubes, such as the 4CX400A or the 4CX1600B? There is an article in COMMUNICATIONS QUARTERLY for Winter 1995 which addresses the RF circuit design fairly well. I need help more in the area of the required screen grid power supply and the associated control and protective circuitry. Any help or hints greatly appreciated.

>BOX). SBFFT is like this.

Yeah, at least you can get the main screen up if you reboot to DOS mode,
but when you give it the run command, it crashes and burns. It appears
to put the SVGA card in a very strange mode. The monitor goes into sweep
protect. And the only way out is a hardware reset. That's with it configured
for the default 640x480 mode, which should work on any hardware. I haven't
tried it yet in 1024x768. PC is a 100 MHz 486DX4 with 16 Mb RAM running
Windows 95 and using an ATI Mach64 video card and a Soundblaster 16 sound
card. I configured the EMS memory, and at sign on the program Oks that and
finds and checks the sound card Ok too. But give the Run command and the
screen goes dead and the machine locks solid. Not pretty.

766. Software for doing system noise calcs.

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-21 00:00:00 UTC
From: au156@yfn.ysu.edu
Message-ID: <5c3b45$ltc@news.ysu.edu>
Source record: 98319

I'm looking for a simple shareware program that will make it possible
to evaluate the path losses and system noise for a system comprising
an airborne transmitter and earth-based antenna, preamp, feedline,
and receiver.

The important part is the system noise temperature, but the path loss
and output carier-to-noise would be nice to have, too. This program
should accomodate total antenna effective noise temperature; and the
noise temp. of the preamp and receiver, of course

Niceties such as separate inputs for cosmic noise, earth thermal
noise as seen by the antenna, and other refinements are good
but not necessary.

This is to answer a question about the performance of an amateur radio
application (high altitude balloon beacon). A *quick* search of Oakland
did not yield anything that looked appropriate.

Anyone have any obscure ham or *industry* software that will handle this?

From: Brian Padgett <bpadg@uniserve.com>
Message-ID: <32E507F0.1B02@uniserve.com>
Source record: 98324

I'm wondering if anybody operating mountaintop repeater sites have had any success using wind generators. Our experiences have led us to conclude that no one makes wind generators that have any long term reliability. I would be interested to share any information with the goal, at some point, of being able to have a reliable source of wind power.

We use wind to supplement the sixteen solar panels already installed and connected to about 2500 AH of bateries.

Our best wind generator survival period is only about 4 weeks after which time either the generator has bornt up, slip rings have disintegrated, blades have broken off, and so on. This using wind generators that supposedly have 100 MPH survival ratings and at a site where the wind doesn't exceed 50 MPH.

I am currently building a pair of the 600 watt amps listed in the Motorola bulletin AN 104. I am combining them for 1 KW. Each amp uses 4 MRF-150's with 50 VDC supply voltage. This eases the problems with IR loses from heavy currents, and gives redundancy in the event of transistor failures. I have used the MRF devices in extreme industrial applications and have found them to be almost (I said almost) industructable. I think out of hundreds of units, in unbelieveable conditions, I've seen one failure.

There is a company in Ohio, Communications Concepts, I think, which offers kits of parts. But you must provide the packageing. (513)426-8600.

Hope this helps.

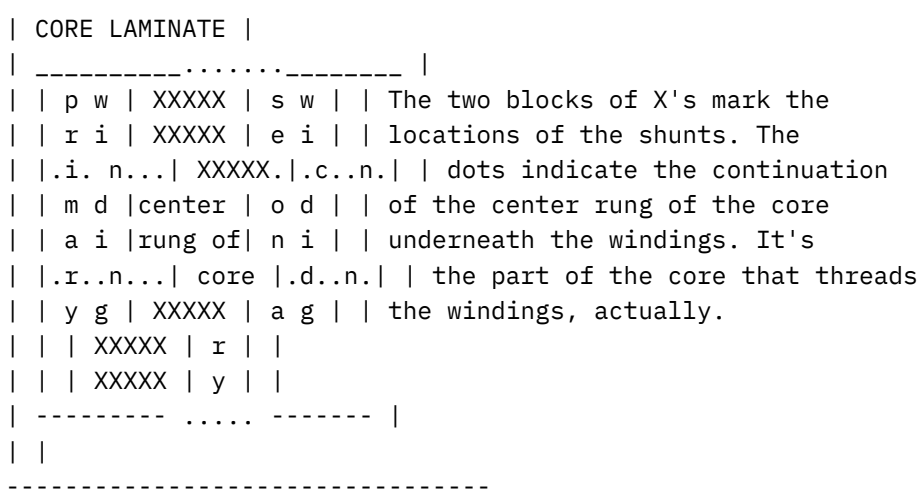
>Bruce,
>I have just such a transformer from a 550W microwave with 1500V on the
>secondary and everything is as you describe it. But - what are the
>'shunts' you speak of. If you describe them I can look see and learn.

In words:

If the core is a figure eight, standing upright, then the windings are at the left and at the right of the center horizontal bar, and the shunts are little rectangular bars about the size of two after dinner mints stacked atop one another. There are two, they separate the windings on the left from those on the right. Mine weren't stuck in by any kind of glue, they were just press-fit into the space. Tapping on them with a hammer pushed them out, and now the transformer is shuntless.

In ASCII:



I hope this helps. One way to convince yourself that you have actually located the shunts is to see where the magnetic field goes. If there's a low-reluctance (i.e. iron) path for the magentic field to go from the primary back directly to the primary again without having to also go through the secondary, it's a shunt. If all the magnetic field going from the primary, through iron paths, MUST also thread through the secondary, then there are no shunts.

>

Oh, well.......

I think it gives a friendly and nice atmosphere to this group, since most
of the writers include their call. But judging from your mail you dont seem
to be interrested in keeping that atmosphere.......... It's as they say:
You get what you ask for!

I have a little 'c' program that calculates what you need for loop
antennas. Note that there is a "permiability" times "area" term.
You can use a rod or large loop to get the same effective height-- which
is what you care about. Ferrite will give more phase shift.

I will post the program, which is based upon Chapter 4 of "VLF radio
engineering" by A.D. Watt. A must read if you want to pursue VLF antennas.
You'll have to find a good library to get this book.

Steve.

That was the idea. Does it seem likely or unlikely that the average ham station would produce 8v or more at the antenna tuner?

> When silver plated relay contacs fail to connect, all that is required is

Good point, Tom, although this caveat does not apply to all types of relays.

I proved that SWLs should use fine steel wool to remove silver-sulphide tarnish, and for hams running 100w, it's optional.

Works for me 486 - 33mhz, 8meg, soundblaster, etc
(Gotta use EMM386 or as Don has Qemm.)
Decoding takes some tweaking but I got it working in the ham
bands on rtty and weather FAX.

Every decoder I have (hardware) really takes tweaking and
experience, I am still evaluating this
software (shareware), but it looks promising.

> Why do VHF parasitics cause band switches to arc?

Might there be fireworks if a 1000W, 100MHz oscillator were operated with virtually no load?
In a typical HF amplifier, the tank circuit is a low-pass Pi filter that blocks VHF energy. Thus, if VHF regeneration appears at the anode, it has no where to go. IMO, something would be likely to give.
Bandswitches do not necessarily arc during a VHF parasitic. When Heath was using a 3500v-rated tune-capacitor in the SB-220, bandswitches rarely arced, but reports of tune capacitor arcs were common. I own such an amplifier, and the tune-cap. has numerous pits from arcing. However, when Heath started using a tune-capacitor with a higher v-rating, reports of bandswitch arcing in such amplifiers became fairly common.
Arcs typically prefer to jump the gap with the lowest breakdown voltage. However, like Murphy said, Nothing is as simple as it looks. Thanks to tests performed by Mr. Rauch, another factor appears to be the internal VHF resonances in the tune-capacitor. Based on his measurements, it seems that a tune-capacitor which does not exhibit a VHF resonance near the frequency of parasitic oscillation is less likely to arc than are contacts on the bandswitch. (see Figure 15 on <http://www.vcnet.com/measures/>) In these photographs, the 10m and 15 meter contacts are partially vapourized. The amplifier from which the two burned bandswitches were removed has no VHF resonance near the frequency of oscillation (c.160MHz). IMO, burned 10m & 15m bandswitch contacts is the signature of a VHF parasitic oscillation. [See kaput bandswitch in "Parasitics Revisited", 9/90 and 10/90 QST. Also see my first post on 1/17 (<measures-1601970917370001@port17.vcnet.com>,)]

> Is a VHF parasitic oscillation the only thing which can? (I assume so,
> since the presence of arcing bandswitches seems to be presented as adequate
> proof of VHF parasitics.)

There are other sources of tank arcs. An antenna-tuner capacitor arc caused an arc in the Johnson 226 roller-inductor in my general-coverage homebrew 8169 amplifier. David Holtcamp, K5KH, recently discovered that a defective lightning arrestor installed in the feedline caused a tank arc in his TL-922. Moths, spiders, and heavy lint accumulation can cause arcs. I had an occasional spider-problem in an 8171 amplifier that uses a 9100v anode supply.

The best protection against peripheral amplifier damage, as the result of arcs, is a fault-current limiting (a.k.a. 'glitch') resistor, in series with the anode supply. Such a resistor must be able to survive discharging the high voltage filter capacitor. Svetlana recommends a glitch R of c.25 ohms for a 1500w anode-dissipation tube. Glass-coated, wire-wound resistors can be used for this purpose, provided that they have a high length/diameter ratio. Eimac began recommending such resistors around1986.

> Has anyone ever actually directly detected the presence of VHF oscillation
> (with a simple wavemeter, for example) in one of these amplifiers, then
> confirmed that the condition no longer exists after applying a fix?

Marvin Born reportedly saw a 78MHz parasitic oscillation on a spectrum analyzer and on an oscilloscope in a Create Electronics 3CX3000A7 g-g amplifier. After replacing the burned bandswitch and installing a 100% nichrome VHF parasitic suppressor, no arcing was observed in the replacement bandswitch. However, I am certain that low-level damped wave oscillations at 78MHz still existed in this amplifier whenever the anode current decreased or increased suddenly. The best way to observe this phenomenon is to send 50wpm dits with a CW keyer.
I do not have a spectrum analyzer, so I have to depend on those who do.
A customer who bought a suppressor retrofit-kit for an SB-220 reported that he could see damped-wave VHF ringing in the anode circuit when the amplifier appeared to be stable. No mystery there, Roy,---ringing a tuned-circuit with a current pulse is basicly how spark transmitters generated RF in days of yore.

> Is this science or art?

Some say art. Some say black art. Some say $cam. Some say unsliced bologna. Some say science. However, it's nothing new. F.E. Handy wrote about the method on page 72 in the 1926 *Radio Amateur's Handbook*.
I find it somewhat curious that one of the naysayers who claim that low VHF Q suppressors are the worst kind of 'wurst', rejects areas of science that do support his conclusion. This person is seemingly unfamiliar with algebra and scientific notation, and rejects accepted AC Circuit Analysis methods whenever they fail to support his conclusions.
When Wes Stewart's scientific measurements indicated that a conventional VHF suppressor would create 63% more VHF voltage gain than a similar low VHF-Q suppressor, this person switched into ignore-mode and smokescreen-mode.

I also run ATI Mach64 card. (also QEMM)
My vidio card required the VESA driver.

This card has some strange behaviour with
programs that make VESA calls without the
driver.

Look for 64VBE200.ZIP from ATI. Contained
in this .ZIP is the driver M64BE.COM which
is a DOS TSR.

BTW the program runs in an OS/2 DOS full screen
session (with the tsr installed.)

Question: What is a simple, inexpensive, and convenient way to start
this year off in a FUN, intriguing, and romantic fashion?
(Santa must have been holding out on this one!)

Answer: Dateline!

Now that Christmas is over and you have given everyone else presents,
it's time to treat yourself to something nice.....that someone
special. Someone to share in your hobbies, your interests, your
lifestyle, your LIFE.

Dateline is the perfect way to find someone and be found! Dateline
gives you the forum to seek out others whom you find interesting, and
let others know about you! And the best part is - you are in control
of what happens. Call often to leave and receive lots of messages
(remember - this service is HUGE and there are so many people from
all the area codes across the country calling in to find people just
like you!), or call in as little as you like and leave and receive
a few selective messages. You can also call just once to see what the
heck it is all about. Whether you are a little shy or outgoing
in the biggest of ways - it is a simple and inexpensive way to find
other singles. It is amazing how much fun people have with Dateline!

It is so convenient! You can call in from anywhere at anytime to give
and get your messages. This is a 24 hour service and you just punch
in whichever area code you are interested in - whether it is in the
place you live or the places you go! And it is really super if you
relocate and want to meet up with guys and gals who share your
interests and would love to show you around! (No wonder Santa is
always so jolly - his sleigh phone has the Dateline speed dialed in!)

1-900-484-7009 ext. 5241

$2.99/min. Must be 18 years or older.

Serv-U (619) 645-8434

Make this your Happy New Year's Resolution: To call Dateline today
and start giving and receiving those personal messages! Join in the
fun - and don't keep those folks who want to meet you waiting until
next Christmas.....

I played around with a ferrite rod and a tuned winding to look at the 60kHz the other day. I was using a tuned voltmeter. I'm in Colorado Springs and the signal was HUGE - a millivolt or more.

The funny thing was a distinct 120 Hz modulation on the signal - synchronized with the power line. I didn't do much checking, but I believe it is a kind of intermodulation caused by nonlinearity in the ferrite when exposed to stray power fields.

It was an Aidon rod.

The "other" problem is that Win95 still seems to "own" the
soundcard when you are in a "DOS" box. The program does not like
that. You will get an "interrupt" error or similar.

Make sure himem.sys is loaded in your config.sys and "emm386.exe
auto" is in your dosstart.bat. Exit windows with the "restart
computer in dos mode" menu. You will then drop right into DOS.

I have had good success with it. It works! I got a perfect copy
tonight using a DX-440.

Pentium 120
S3 Vision 330 PCI 2MB
Soundblaster 16 value PNP
64 Megs RAM
Running Win95's stock EMM386.exe and himem.sys

640x680 and 600x800 worked fine, 1024x768 seemed to revert back
to VGA.

Unless you have a "magic" soundcard, you will probably have to
tweak the <esc>/Settings/Demodulator/Clock-cal setting.

Type <ESC> S D C

At first, I got a screen-full of scrambled lines. Totally out of
sync. Slowly decrementing the value, I got it to "straighten
out". It straightens out all the stored data, too. So the whole

image should "snap" into place.

My final clock-cal setting was 0.98698. You may need to step in increments as little as 0.0001 to "zero" it in.

Good Luck!

I used the technique described in the Spring '91 Issue of
Communications Quarterly to size the capacitance. For my antenna,
a 22-turn sqaure loop with a cross-sectional area of 1/2 square meter
(not 1/2 meter on a side) it turned out to be 0.0126 uF.

This particular antenna has the windings fairly well separated. This
gives rise to a fairly low value of distributed capacitance (the
self-resonant point was on the order of a MHz or so) and hence requires
a lot of external capacitance to resonate at 60 kHz.

803. Need Info & Comments, Differential-T Tuner

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-22 00:00:00 UTC
From: mmss@mmss.sdi.agate.net
Message-ID: <5c5gnm$jes@service-2.agate.net>
Source record: 98208
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi,

I am set to embark on an adventure. I want to try building a computer controlled fully automatic antenna tuner. This ought to be fun...

It would simplify things if I only had two components to adjust (at least I think so) instead of the usual three. I have noticed something called a "Differential-T" tuner that is being produced commercially, which has just two adjustments: the roller inductor and the differential capacitor. Hmm, interesting... maybe.

Can anyone who owns one of these tuners please tell me something about it? Does it tune easily or is it terribly finicky? Does it require a lot of juggling back and fourth between the inductance and capacitance settings to achieve a match? Or is it more or less possible to adjust one element, then the other and have a reasonable match right off? Are there situations where it will not tune? (I am primarily interested in tuning coax-fed antennas. For example, I have a 5 band trap vertical that doesn't provide low enough SWR on some frequencies for my rig).

Also, can anyone tell me the circuit configuration and component values? I'm not at all sure how they have the inductor and capacitor connected. Oh, yeah, are both sections of the differential cap the same value, or are they different?

Any information would be appreciated. I can probably build my own differential cap, but I'd just as soon not go that far until I have some idea whether this circuit will work for me and what value to shoot for.

Ahh, I do love projects that let me combine computer programming with ham radio!

Oooooh, so your one of THEM! One of that organization that is supposed to be representing us, yet plays "See no evil, hear no evil, speak no evil" when it comes to the fact that the majority of licensed hams,(many of whom are General class & above), want CW testing and CW priviledges made OPTIONAL for General Class & above, and many of whom would prefer to see a hands-on "lab" project,(with the degree of project difficulty based upon the license class being applied for), offered as an alternative to CW testing.

I brought up and said all of that to say this... WHEN DO WE GET THIS ALLEDGED REPRESENTATION???

806. 240V VHF MOSFET PA's?

Source record: 98211

Is there such a thing yet as a 240 Volt MOSFET Power Amplifier device for upto 300 MHz yet? The last I checked there was a line of 240V MOSFET's made by the Harris Corperation for upto 3 MHz, 300 Watts Max Output, which is what the Harris AM Broadcast Power Amps use as their finals now,(most commercial 530-1700 kHz AM Broadcast stations in the world now have completely solid-state transmitters upto 100kW).

I've been waiting and waiting for such a device for HF and VHF use... so like the old Campbell's commercial used to say... "Is it soup yet?"

I can't believe you guys are acyually encouraging each other, and what's worse, encouraging new hams to STOOP to the same kind of ILLEGAL crap that the CB operators do. If you stoop to an illegal CB'ers level, then that makes YOU nothing but an illegal CB'er yourself and deserve to have your license revoked and all of your ham equipment auctioned.

What the HELL were you dimwitts THINKING? What the HELL is WRONG with you? How could you even fix your face to suggest that a fellow ham do illegal crap like that. WE are SUPPOSED to be ABOVE that! WE are SUPPOSED to do things LEGALLY! Let ME catch a fellow ham pulling that shit and I won't bother looking for an Official Observer... I'll personally drag his ass to the FCC myself and have him made an example of.

HOW DARE you idiots lower the ham standards of conduct, and in PUBLIC too!!!

You need your license and equipment taken, and maybe you need your ass kicked too for making the rest of us hams look bad! WE ARE NOT OUTLAW OPERATORS! DO YOU UNDERSTAND THAT? So if you want to clean up the airwaves, we can start right here, by disciplining our OWN ranks!

Anyone wanna form a physical-discipline committee? I have a razor-strap!

True, but the *antenna* is directional. If the thread is about lack of
reception, Murphy's Law says that the rod is aligned *exactly* in the null
direction. (;-))

Well, I might be able to help you with that. Make sure you have your
EMS memory manager installed in config.sys, and make sure it isn't set
for NO EMS (that's the default way it'll be with Windows). Just delete
the NO EMS from the line and reboot.

> Phase shift of what with respect to what?

Compared to a perfect frequency standard. The transmission path contributes
a time delay (phase shift). Since ferrite has temp/freq dependent properties,
you will measure a shift in the relative phase of your received signal compared
to your reference standard. If you are using the antenna in a calibration
system and the antennna experiences a large temperature swing you can see the
phase shift. Note that this is hard to see unless you are doing better than
about 1e-9 relatively frequency measurements. Good enough for most of us.

rev 1: June 20, 1990 Fixed units in formula

coil.c

This program calculates the voltage induced on a solenoidal loop antenna
immersed in an uniform field of e uV/meter. Inputs to the program are
permeability, turns, area, field strength, and frequency.

***********************************************************/

#include <stdio.h>
#include <math.h>

main()

{
float freq;
float N; /* number of turns */
float A; /* area of core */
float mu; /* permeability of core */
float e; /* field strength in uV/meter */
```

```
float V; /* induced voltage in uV */
float L; /* effective length of coil */
float d; /* diameter of coil */
float pi=3.141593;

/* input all the user data first */

printf("\n\tinput the center frequency in kHz: ");
scanf("%f", &freq);
printf("\n\tinput the core permeability: ");
scanf("%f", &mu);
printf("\n\tinput the number of turns: ");
scanf("%f", &N);
printf("\n\tInput the value of the incident field in uV/m: ");
scanf("%f", &e);
printf("\n\tInput the diameter of the solenoid in cm: ");
scanf("%f", &d);
printf("\n");

/* calculate the values from the given */

freq = freq/1.0e3; /* formula requires MHz */
d = d/100.0; /* convert to meters for use in formula */
A = pi*(d/2.0)*(d/2.0); /* ignores wire thickness */
L = 0.021*mu*N*A*freq; /* formula from 5th ED Radio Engineers HB */
V = L*e; /* effective length times field */

/* output the results */

printf("\n\tA field strength of %.1f uV/m a coil with\n",e);
printf("\t%.0f turns on a %.2f cm diameter core with a\n",N,100.0*d);

I have a couple of Heathkit transmitters using this type of mod, the
DX40 and DX60.

Advantages: requires less power to modulate the carrier.
Disadvantages: Amount of distotion depends on antenna loading, so to
get best results u need an audio sinewave generator and a scope
looking at the mod envelope!!! But this way good mod can be achieved -
providing you don't want to QSY!!! 100 percent mod not usually
possible.

Even though the DX60 was the successor to the DX40, the mod quality
fiddly and tune-up for best results were no better! (Although the
chassis design was MUCH better. Pitty it made no difference on the
air!)

As u can see, it's not worth the effort unless u are restoring an old
amateur radio transmitter.

Howdy...

The Alaska Railroad guys are using some small wind gen sets for
their remote signal crossing power. I've blown off the name, but they were
built in Merry Olde and were stainless steel, marine units. ARR said they
were happy with them. ARR's conditions were more on the cold side rather
than the really big wind side, tho. I may be able to track them down if
you need more info..

Paul, your project sounds very interesting. The automatic antenna tuner in my Icom IC-765 does just what you are talking about - you might want to get hold of the tech manual for that or a similar rig for ideas.

I have done a limited amount of tuner circuit modelling by deriving the equations for the circuit and then expressing them in a spreadsheet using complex notation and operations to handle reactances and complex impedances. Very interesting exercise and very enlightening as to to capabilities of a given circuit with specified component value ranges to handle various load impedances.

A good modelling/simulation program, such as the one ARRL markets, would probably be much more convenient to use. At any rate I urge you to consider modelling first to arrive at a suitable design and approximate component values as a starting point for the software phase.

Keep us posted on your progress.

Tom,

Your best bet might be to buy a MiniCircuits VCO. They make
both thru the board and surface mounted units that will tune
100-200 mhz with -105 dbc/hz phase noise with all harmonics
at -25db. Their single lot price is about $15.00 ea

Try their web site at http://www.minicircuits.com

If Dave contacted you privately before the public announcement, why did
you go ahead announce the arcing was caused by a parasitic? If you
experienced an arc in your tuner that caused your PA's tank capacitor to
arc, why didn't you ever indicate or admit an arcing problem could be load
related?

>was due to a largely-unloaded VHF parasitic oscillation.

Three times you indicted the 922 arcing had to be a parasitic. It was your opinion. It was your conclusion.

You posted that conclusion knowing full well that it could be a load problem, you admit you did so **after** Dave indicated in E-mail it was an arcing lightning arrestor.

In article <measures-ya02408000R1901971257220001@news.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:

You intentionally omitted evidence you discovered four years earlier that contradicts your public posture that parasitics are the only cause of tank circuit arcing.

You misled us about the AL-1500 that you NOW admit was not even an AL-1500. (Marvin said there is no way you didn't know that from the very beginning, he said he was very clear about what the PA was.) You did the same with your claims about conversations with Eimac.

Rich, how can anyone trust you?

While it's not shareware, I've always used Excel or Lotus 123 to do
such calculations. None of the calculations involved strike me as
particularly complicated, once you master the Friis equation (And can
keep the difference between dB and numeric values straight).

My favorite reference for that sort of stuff is
"RF Design Guide" by Peter Vizmuller. Published by Artech house,
it's a nice updating of Ernst's book "Receiver system Calculations".

Well Rob that's your opinion and I think YOU are a bit out of line to attempt to speak for the newsgroup! I subscribe to this newsgroup and you sure don't speak for me.

I happen to think that he's right in step with what's going on here and I am pissed off about it too! Have you ever bothered to post the same message of inappropriateness to those who are responsible for the thread in the first place?

Does anyone else out there think it is appropriate to post a question asking how to jam someone (or post a reply telling him how) and jump on the guy who brings the absurdity to light?

834. Sat weather maps the cheap way: questions o plenty...

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-23 00:00:00 UTC
From: helling@uwindsor.ca
Message-ID: <E4G89B.B0x@news.uwindsor.ca>
Source record: 98237
Cross-posted to:
rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.scanner

A few questions on the fine points of weather satellite image
reception...
(on a shoestring budget.......)

I have read the article in Nuts and Volts, picked up the LM741
fuzzbox interface for my Pc (it does reemble a crude guitar
fuzzbox effect...what an odd way to get square waves!!!!)

My ancient heathkit GR-64 has a BFO, am bust dusting it off,
Won't hook the mess up until I get an isolation xformer for
the patch...

AND.... Tadah.... just scored an ancient Radio-shack PRO-33
20 channel scanner for that all-important 137 MHZ reception...
As the scanner tunes in 5KHZ steps, it might even
tolerate the reported doppler shift...

SO......
1) Assuming I find an antenna, will the little 741 interface
and the shareware program for weather fax I got with it do the
job for 137 MHZ reception ?

2) the Nuts &volts article has a diagram of a double crossed
dipole antenna. Bottom cross must be grounded as "reflector",
right? Top one is PVC and wire along the sides, just like the
ancient RLL handbook design... OK. but what length??? The
formula in my 1970 Arrl book doesn't look too useful over 50MHZ
or am I banging the calculator wrong???

Any suggested lengths???? Got baling wire o plenty...
(then off to the cable co dumpster for coax.... and away we
go...)

3) I am really interested in the High Orbit 1691 MHZ sat
images... But that $US600 downconverter.... ulp...
On the other hand, I garbage picked an old sat reciver a while
back (swapped it off.... they aren't worth much if they don't
de-cypher) Now.... hmmmmm..... Conversions anyone???

3B) Those really cheap mini-sat disk systems being sold to
hook one in to paying subscription fees forever.... wonder how
modifyable these are....

Ok...at this point my ignorance is REALLY SHOWING, but heck...
one week ago I was ripe for a Ramsey 137 MHZ kit (fortunately

I am perpetually broke), and then I pick up the scanner at a
2nd hand store for CAN$30.... As a bonus, I get to hear the
walky-talkies at macdonalds 4 blks away (YAWWNNNNNNN!)

This sat stuff looks great.... (I used to mess with
electronics and DX a bit, went to University, got useless
degree, decided to have FUN, went to ART school, got a REAL
USELESS DEGREE, and now do gallery sized set-ups involving
wonky technology... Still can't draw worth a %$&....
So what If I recycle a few sci-fi plot lines here and there...

TRY this....
Sat receiver => computer => stored images scripted to slide
show mode, adding latest image to end => cheesy VGA-2-video
coverter => rented scan rate doubler => rented video projector
high up projecting on the floor of a darkened room...

OOOOHhhhh..... View from a height....

The pro sat pictures from high orbit would be best, but the
low orbit ones are a good start...

Any tips, sites, advice, apreciated big time...
Thanks & regards.... B/H

There's supposed to be a small cyclical phase shift over a 24 hour
period due to changes in the path between the transmitter and receiver. Is
the typical shift due to a ferrite antenna a lot larger than that?

Greetings, all...

I have a 50 Watt 2-meter rig in my car. I also have a car stereo system in this car, which had been dead for years but I recently had repaired. Since having the stereo repaired I've not transmitted because I'm concerned about the possibility of damaging the front-end of the stereo.

The antennas (antennae?) are only 4 feet apart. Is my concern valid?

If I should be concerned, what are my options? It seems to me that my possibilities are putting a PIN diode across the antenna input, or a low-pass filter with a SHARP roll-off.

How would I choose appropriate components? How are PIN diodes rated? Breakdown voltage, or some equivalent?

For the low-pass filter, it seems that I have enough information between the Handbook, antenna book, and Advanced-class (!) study guide. However, it also looks like a large number of combinations for series L and shunt C are valid. Is there a "best pair?" How do I choose that pair?

(Is it even practical to use a low-pass filter considering that 108 and 144MHz aren't even an octave apart?)

I really could use some guidance in protecting the stereo. It seems like no commercial version of what I want exists.

Thanks much in advance,

Isn't it amazing how as soon as someone asks how to modify a radio to
use for marine or something they are told right away, how they cannot
do that because it is not a type accepted radio, which while not legal,
is magnatudes less of a problem than advising someone how to jam a
signal, even using spark gap methods.

Could it be because the guy was wanting to Jam a CB users, naw, hams
would never be that prejudiced against another radio service.

I would guess from the original post, that this is a group of high
school or JR high kids who chat at night on CB, unless they are
plotting muggings, or drug deals, I can't think of the reason to jam
them, except for retaliation for something. If it is TVI, call the FCC
and they will send you a book on how to fix your junk consumer

electronics products to fix the problem.

I need:

R390-A receiver
R-1155 receiver
T-1154 transmitter
AR-88 receiver
R-109 receiver
AN-GRC-109 transmitter

TV7-D/U tube tester

Any good newer style tube tester that can do the
compactrons etc.

Any good transmitting tube tester.
Such as Hickok, B&K Heath etc.

A Grid Dip Oscillator

PI-WOUND RF chokes such as 2.5 mH at 200mA or better.
Also need some smaller ones.

Any good transmitting tube tester.
Such as Hickok, B&K Heath etc.

Tube socket Adapter kit for I-177B tube tester

Greenlee punches - all types & sizes needed.

ANY BOOKS from 1930-1970 about ham radio construction.
Tube manuals, etc.

QTY of TWO or FOUR: 7-pin sockets for 1625 tubes

807 tubes
811A tubes
572B or similar tubes

1 watt and 2 watt resistors,

FT-243 crystals for 3500 - 3600 kHz & 7000 - 7150 kHz

PL-259 / SO-239 connectors

Capacitors: MICA, MYLAR, Electrolytic etc.

Any useful AF/RF tubes...

Audio transformers.
Interstage transformers, Single anded and P-P Output transformers

Modulation transformers

"MULTI-MATCH" Modulation transformer in the 100 watt to
500 watt class.

Old tube equipment, chassis, carcasses etc.

SO-239 and PL-259 connectors

Older AM and CW transmitters and/or receivers.

Homebrew radio transmitters

Desk microphone - dynamic preferred.

Any straight key.

A BUG

I would like to swap for any of the above items.

WHAT DO YOU HAVE??

You would do well to check the dates and times of these events in Will's archive, Mr. Rauch.
>
...snip...
> >IMO, the
> >mysterious intermittent arcing is VHF parasitic related. .
>
...snip...
>
Mr. Rauch---FYI, on the Internet, 'IMO' is an abbreviation for 'in my opinion'. Is an opinion the same as a conclusion?
There are obviously lots of things that can cause tank arcs. I provide room and board for a male cat named B.W., who has all of his original equipment, who, when the mood suits him, emits a rather impressive cloud of conductive mist out of his stern end, that smells quite unlike Chanel Number Fiveï¿½.

Why don't you ask David Holtcamp what I told him before and after he discovered that the lightning arrestor was the instigator of the tank arc.

How do you explain the arc pits that David observed on the tune capacitor prior to the use of said lightning arrestor? Why did the TL-922 at W1AW, and numerous other TL-922s, apparently stop arcing after the vhf parasitic suppressors were replaced by low vhf-Q/low vhf-Rp suppressors?

> You posted that conclusion knowing full well that it could be a load
> problem, you admit you did so **after** Dave indicated in E-mail it was
> an arcing lightning arrestor.

Those who would like to see if Mr. Rauch has his facts straight can look in Will's archive.

> You intentionally omitted evidence you discovered four years ......snip......

Nah, this was discussed at length on the air at the time it happened. I
have written about it in e-mail.
>
> You misled us about the AL-1500 ...snip...

ROFL, L ,L, L........how many times did I ask you whether or not the
AL-1500, which you say you designed, has a vhf parasitic oscillation
suppressor? I'll bet a large pizza with 3 toppings I asked you at least
six times, Mr. Rauch. Sure the amp. Marvin was working on was built on a
AL-1200 chassis, housed in an AL-1200 cabinet, and it currently has one
8877 instead of one 3CX1200A7. Curiously, when Marvin made this
clarification to me on the telephone, he had no idea whatsoever who Tom
Rauch, W8JI, is. Within an hour after talking to Marvin on the telephone,
I posted the correction. Most fortunately, since I am NOT a
self-recognized amplifier expert, I don't have a title to defend, so
admitting blunders is no-prob. at all
>
> Rich, how can anyone trust you?

Some folks seem to. Some folks do not.

Did you design the Heath SB-1000 amplifier?
Is the bandswitch in the SB-1000 interchangeable with the bandswitch in
the AL-80?

IMO, at this point, we need to discuss Wes, N7WS's parasitic suppressor
measurements..

If you can get your hands on some 6 1/8 inch rigid airline, used
in broadcast, it'll make fine notch filters. But the smaller hardline
commonly available doesn't have a high enough Q to be useful for a
narrow split duplexer.

Usually a lot smaller (unless you have a problem) but could be "random" with
respect to other sources. Again it isn't a problem unless you are doing
precision work.

Hello,

My name is Chiron and I'm a student at a Dutch school.
There are a lot of VSRW measuring equipment available in electronic shops,
but I can 't find books or other literature about the theoritical working
of those VSWR equipment. The prinsipal of VSWR is not a problem but I want
to know some implementations and how it works.

If you know some good books or publications please send me a mail.

Greetings and thanks in advance

My two questions: Why should the presence of spurious
VHF resonances be taken as proof that the amplifier is

being damaged by VHF parasitics? Where is the feedback
path, and are the phase angles such that oscillation are
suppressed or enchanced?

I can understand the plate tuning capacitor breaking down, but
the bandswitch -- even on ten meters -- is downline of the
tank coil and in parallel with the loading capacitor. To my simple
mind, this sure looks like a lowpass filter.... What are
the impedances of these components at the parasitic frequency,
and what will the VHF voltages be at the bandswitch when the
parasitic occurs? Why should the bandswitch arc over before the
breakdown voltage of the tuning capacitor is exceeded? Maybe the
cause might be instead related to high SWR or mistuning?

What is the main component of the "VHF" resonance? Is it
the plate strap combined with the internal plate assembly
within the PA tube?

Why doesn't the parasitic oscillation manifest itself whenever the
amplifier is in use? If it is a very sporadic occurence, how do we
know for sure if any bandaid fixes are in reality curing the problem?
Ie: How do we know the same variables that caused the initial
incident to happen are being duplicated?

How can someone armed only with a grid-dip meter, and a neon lamp --
sans spectrum analyzer, network analyzer, Q-meter, etc. determine
what is the real cause of any amplifier flashovers, and then market
a UNVERSAL fixall?.

Without laboratory measurements and scientific analysis, it
is bad science.

>proof of VHF parasitics.)

Two very fair questions, to which I'd like to add:

When the arcs occurred, were the switches actually using the contacts
that arced, or were they set to another band?

If the arcs really were due to VHF currents flowing in the
inductor/bandswitch combination, there surely has to be a strong
spurious VHF resonance somwhere in there. Without a VHF resonance in the
inductor, how could it develop VHF voltages/currents high enough to
create an arc? Has anybody detected such a thing with a GDO on/around
the pi-tank coil?

If there is no detectable VHF resonance, that argues very strongly
against the arcs having been caused by VHF energy.

My experience has been exactly the same as Roy's. The acetic acid is absorbed as the material cures, and when the process has finished there's none left over. Chew some - there's absolutely no trace of vinegar taste.

Sure, I've sometimes seen corrosion underneath it, but that also occurs sometimes with solvent-based sealants. I don't think it's directly connected with the sealant itself.

Eric, I wouldn't worry about the damage potential. As I recall there
have been "couplers" available for years that allow use of your AM/FM
car radio antenna simultaneously on receive for AM/FM broadcast and 2
meter FM. Looks to me like this would cross-couple more energy than 2
non-resonant antennas 4 feet apart. Plus I've used even closer antenna
spacings over the years running 25 watts on 2 meters and at one time 100
watts, with no apparent damage, and I do quite a lot of stereo listening
too so I'd have noticed if the front end had died.
One way to protect the stereo antenna input (if you insist on worrying
about it) would be to make a small inline box with appropriate car AM
input/output connectors that contains back-to-back 1N914 or 1N4148 or
equivalent diodes connected between the center conductor and the shield
with as short lead lengths as possible. In normal receiver operation
the diodes would not conduct, but if they "see" any RF or other voltage
higher than around .6 volt they will conduct, thus holding down any
voltage spikes your receiver might be forced to deal with. This is
typical protection added to switched preamps and other potentially
high-risk receiver input systems.

Hi Paul, check out my web page for another idea in autotuners. I'm working on one that uses 4 relays and one variable capacitor. The 4 relays are used to switch in 0-15 ft of ladder-line to position the capacitor at the PC-200 point where a Parallel Capacitance will result in a purely resistive 200 ohms for a perfect match to a 4:1 balun and there's no lossy tuner coil anywhere.

Tom, I don't want to get in the middle of this in the least, but as I recall, I posted Rich privately slightly before I posted it publicly (attempting to be polite to him, since I knew his diagnosis and what I found were not in agreement). I remember reading Rich's last message posted *before* he got my email or the public posting - they had passed by each other in the Internet Ether by some minutes or hours - I don't remember exactly.

Just info to try and set the precise record straight.

From: Steve <thebizlk@erols.com>
Message-ID: <32E7EF94.1386@erols.com>
Source record: 98269

Yes, the DX-40 and DX-60 did use screen modulation BUT it was of the controlled carrier variety. That means not only did the audio modulate the screen voltage, that actual DC value of the screen voltage also varied with the level of audio. When no audio was present, the screen voltage was at a very minimal value, hence minimal RF output from the final amp. Increased audio, meant increased screen voltage, thus more RF ouput.

This type of modulation is quite a bit different from straight screen modulation (fixed DC voltage) in operation and audio quality.

>message of inappropriateness to those who are responsible for the thread in
>the first place?

Necessity does not warrant it. They have a right to ask these
questions, just as you have a right to either answer the question or
be an info-nazi butt-head. Your choice, and you have made it.

>Does anyone else out there think it is appropriate to post a question
>asking how to jam someone (or post a reply telling him how) and jump on the
>guy who brings the absurdity to light?

Sure.. I'm interested in finding out how others dealt with problems
like these. And I'm sure that the circuits that some may describe
could be modified for "other" uses, other than that intended.
Besides, it's a fun topic. At the least it's slightly humorous. Put a
fuse in line with the nerve that runs to that part of your brain
responsible for your temper; so it blows before you do.

Some of you guys need to unscrew your heads, and thread them right
next time you put them back on. These groups are for the expression of
opinions and ideas, RELATED to the topic intended. It is not within
your authority to tell people here, what is and is not appropriate for
a person or group of persons to tell others in an open discussion if
it IS related to the chartered topic. If you do not want to answer the
question, or add to the discussion, kill the thread and go about your
business. It's that simple.

Frankly I'm tired of hearing people whine about giving out information
like this. And therefore I said what I did. But you will seldom see me
get on a soap box like this. Perhaps you are one of those 'operators'
that lives near this guy and may feel a little guilty? Who knows. I
pitty people who feel they are so 'above' this type of behavior, their
crap doesn't stink. They are probably the ones that tune thier radios
out of (licensed) band(s), ker-chunk repeaters without IDing, and
allways run at full power regardless if the station lives accross the
street or not, and still believe they are within the letter of the

law.

Enough slamming allready. Let them be.

Thanks Ray
Do you plan to run this amp on 160 meters? How about filtering the
output? The filters that CCI sell only go up to 300w. Are you going to
build these? What would you suggest for TR relay. Are there any plans
around for pin diode swithes? Or do they not have the current
capacity.

MY systems don't include any MALICIOUS INTERFERENCE JAMMING DEVICES!

> And then ask them about all of the illegal radios and amplifiers out
> there on 11M.

Screw 11 meters. I say enforce the laws on them too! But since WE are
SUPPOSED to know better, hams should be punished for jamming worse than
CB'ers! At least CB'ers can honestly claim insanity and stupidity as a
defence! What's YOUR excuse?

For Sale,
Hamtronics Repeater Controller with AP3 Phone Patch. All in good condition. All you need is a simple transmitter and receiver. The controller also has a port for an auxilary receiver, good for linking to another repeater. This controller was factory built, not a kit. Comes complete with owners manual. Price is $200 shipped.

The APT signal is about 38KHZ wide, so the scanner
won't yield a useable signal until it's modified.
Usually a resistor across a couple of the IF ckts
will lower the Q enough to get by. You might have
to change a filter. Either way, the signal to noise
ratio is degraded by increasing the bandwidth, so
a pre-amp at the antenna will be helpful.

Yeah, this is going too far. It's really appalling to see someone
actually advocate building jamming gear for the 27 MHz band. Don't
you realize that if you do build and operate this stuff that you'll
cause a lot of interference to those who are trying to develop and
test their spread-spectrum equipment? It's the only reasonable place
that the SS developers can use to prove the noise immunity and
interference-rejection capabilities. So, please, give them a break...

I believe the difference is that the electronic grade RTV can safely be used to insulate HV without having to know for certain if the material is cured all the way through.

Glacial and conc acetic acid is a poor conductor, but the dilute stuff is a good electrolyte. So add silicone sealant and some moisture and poof!! if you're working with high voltage.

You would probably use it too if you had to insulate the top conductors of a 20uF 5kv oil filter cap for your linear, like I did.

Other than that, I doubt there is much difference once the two types are fully cured. But realize that the word silicone implies a whole range of materials- thats why the ingredients on the back are registered as trade secrets. So there may be other differences.

There was alot of discussion about using GE Silicon II on the Tesla coil mailing list this summer. I've used it an its ok at 250kv when fully cured.

Rob.

Message-ID: <9701241403233319@atdbbs.com>
Source record: 98147

>>Anybody got any comments on the Radio Shack frequency counter?

Just FYI, here's the HOLD Button modification:

How to add a hold function to the Radio Shack RF Frequency Counter:

Ground TP17. In the schematic, TP17 is pin one of U3, connected to
+5V thru a 47k resistor. On the circuit board, TP17 is on the display
side, just right of the lower-right corner of the IC. Grounds are about
1/4 inch below and to the right, the three non-tinned points in the large
area of metal.

I grounded TP17 directly and the display stopped. After lifting the ground,
the counter resumed counting at the beginning of a sampling cycle.

Personally, I would ground TP17 thru a 1k resistor. I haven't performed
the mod to my RS counter, since the pads are VERY small and my fine-tip
iron is at work. I will try the 1k Hold mod on Monday and give a report
(unless somebody beats me to it).

An amplifier mod to increase the sensitivity is in the works, reports to follow

Happy Trails to You,
Galen, KF0YJ

> My two questions: Why should the presence of spurious
> VHF resonances be taken as proof that the amplifier is
> being damaged by VHF parasitics?

Because there are clues that such an event probably took place, Peter.
What else would be likely to destroy a grid-I meter. it's shunt-R, short a
cathode-bias zener diode, cause the parasitic-suppressor R to suddenly
increase in resistance by several times without showing any external sign
of damage, and/or summarily weld a 3-500Z's filament to its grid?
The type of VHF parasitic-oscillation that causes such damage probably
lasts under a millisecondand typically creates a big bang From my
experiences, such an event causes an immediate failure of one or more
amplifier components, so having a long look at one is quite unlikely.
.
> Where is the feedback
> path, ...

The feedback path is between the anode and the input element of the
amplifier tube. In a 3CX1200A7, the feedback C is around 0.8 pF. At the
typical anode-circuit VHF resonance, the Xc is around 2000 ohms between the
anode/output and the cathode/input.. In your opinion, is 2000 ohms of
reactance significant at, say, 4000v?

> ...and are the phase angles such that oscillation are
> suppressed or enchanced?

I don't know.

> I can understand the plate tuning capacitor breaking down, but
> the bandswitch -- even on ten meters -- is downline of the
> tank coil and in parallel with the loading capacitor.

I have never heard a report of a bandswitch L contacts arcing while an
amplifier was being used on 10m. Afterall, on 10m, all of L contacts are
closed. // The typical HF tank-L is hardly a VHF RF-choke. By measuring
the VHF self-resonances in the tank-L with a dipmeter when the bandswitch
is in the 80m and160m positions---and by. measuring the anode-circuit's VHF
resonance at the stud on the DC blocking capacitor, a clue might be
provided. If any of these resonances are sympathetic, an interaction is
seemingly possible.
According to measurements made by Mr. Rauch, VHF self-resonances in the
tune C appear to influence whether or not a parasitic arc is likely to

occur therein.

> To my simple
> mind, this sure looks like a lowpass filter....

>What are
> the impedances of these components at the parasitic frequency,'''

I don't know.

> and what will the VHF voltages be at the bandswitch when the
> parasitic occurs?

The measured breakdown voltage of a TL-922's or a SB-220's or an AL-80's ceramic bandswitch exceeds 5500V. The RF peak voltage in these amplifiers is under 2800v. In the TL-922, the measured breakdown voltage of the tune C is 6100v. I have seen evidense of arcing in all of these components that can not be satisfactorily explained by other means If you want to see some photos of burned bandswitches, see Figure 15 at http://www.vcnet.com/measures/

>Why should the bandswitch arc over before the
> breakdown voltage of the tuning capacitor is exceeded? Maybe the
> cause might be instead related to high SWR or mistuning?

Possibly some are. However, some are probably not. Have you read the report from Rick May, KC0HH?
>
> What is the main component of the "VHF" resonance?

The unchangeable constant is the anode-C.

> Is it the plate strap combined with the internal plate assembly
> within the PA tube?

That is part of the total L. However, every L, between the anode C and the tune C is part of the VHF resonance. Naturally, the total L also includes the chassis-L between the tune C ground and the place where the grid is grounded to the chassis. For instance, in a SB-220, the total L is about 160nH.

> Why doesn't the parasitic oscillation manifest itself whenever the
> amplifier is in use?

Why didn't the Space Shuttle Challenger self-destruct before Mission 25?

> If it is a very sporadic occurence, how do we
> know for sure if any bandaid fixes are in reality curing the problem? ...

I don't believe that there is a 100% sure-cure for VHF parasitic-oscillation. However, I believe I know how to go about making them less likely. IMO, a parasitic suppressor design that exhibits a relatively low VHF-Rp will produce less VHF voltage-amplification, which should be less likely to support regeneration. In practice, this approach seems to work.

...snip...
Since voltage amplification is basicly Mu*Rp, in your opinion, Peter,
would a higher or a lower VHF-Rp be desirable if one were trying to improve
VHF stability?
[see Wes' suppressor measurements at
<http://www.azstarnet.com/~n7ws/suppress.html>]

> How can someone armed only with a grid-dip meter, and a neon lamp --
> sans spectrum analyzer, network analyzer, Q-meter, etc. determine
> what is the real cause of any amplifier flashovers, and then market
> a UNVERSAL fixall?.

Neon tends to glow purple at VHF and glow orange at HF. I would not take a
dipper near an amplifier that was plugged into the electric-mains.
>
> Without laboratory measurements and scientific analysis, it
> is bad science.
>
Is naysaying good science? What happened when Pasteur suggested that it
might be a good idea for doctors to wash their hands before performing
surgery?
One of the naysayers in this debate claimed that in a VHF
parasitic-suppressor whose Rs is 100 ohms, and whose Ls is 85nH, at a
frequency of 160MHz, insignificant current flows in Ls compared to the
current in Rs. In your opinion, Peter, is this good science or bad
science?

Mr. Subich's reply did not show up on my news server. Thanks for the relay, Mr. Rauch.

Joe: I received the following e-mail message from Rick after he saw your reply regarding his two toasted AL-80 bandswitches:
quoting---
Rich
..."... I can tell you are wasting your time trying to convince these people vhf parasitics exist in form to destroy bandswitches. If they are blaming it on operator error or non-resonant antennas then they are also barking up the wrong tree. Between myself and the phased delta loops I use on 80 meters, my Drake L4-B hasn't had any band switch or output capacitor problems what so ever. All I know is that I put about 20 hours on the AL-80A the past couple of weeks and it hasn't barked one time. This is with the same rig and antenna I have used for the past 7 years. I guarantee that prior to putting the suppressors in, the arcing would have happened. ..."

73' Rick KC0HH

end of quote.

Steven Kerns (skerns@mail.talon.net) wrote:

(in reply to my request for info on designs for low phase
noise VHF VCOs to cover something like the 2 meter band...)

: Your best bet might be to buy a MiniCircuits VCO. They make
: both thru the board and surface mounted units that will tune
: 100-200 mhz with -105 dbc/hz phase noise with all harmonics
: at -25db. Their single lot price is about $15.00 ea

: Try their web site at http://www.minicircuits.com

Thanks to Steve for the reply!

I like the size and cost of these guys, but unfortunately the
phase noise is too high. Their web site pages on oscillators
seem to be "under construction" with only partial info, but the
latest RF Design magazine came bundled with Mini-Circuits' "VCO
Designer's Handbook," with more complete specs. Phase noise is
spec'd as -107dBc/Hz at 10kHz offset; I'm hoping for somewhat
better than this, but don't need the octave tuning range. And
if I could learn something about design for low phase noise
along the way, that would be great. Any other suggestions?
Anyone?

(BTW, I haven't had time to look at it in detail, but it
looks like the "VCO Designer's Handbook" mentioned above
has a lot of good general info about VCOs and their uses and
measurements on them, as well as specs for the Mini-Circuits
parts.)

> the WWVB signal, but I suspect that is more a misfortune of my location
> than a receiver problem.

Just found my catalog from AMIDON Associates..
12033 Otsego Street, North Hollywood, CA 91607.
I read some thing that led me to beleve they may be out of business though.
Anyway... Ferrite rods are available in two materials:
R61 material - 125 permeability (.5 - 30 MHz)
R33 material - 800 permeability (.001 - 1 MHz)
Does this suggest a possible source for your problem?
Amidon sells rods that are .5" x 2", 4", 7.5" and .75" x 12".
for a .5 x 7.5 inch rod:
R61 - Al(mH/1000t) = 49
R33 - Al(mH/1000t) = 89

We have a WWVB receiver at work made by TrueTime Instruments.
It uses a ferrite rod antenna in a plastic pipe about 10 inches long.
The pipe has a one or two transistor pre-amp in it too.
BTW, I am in Longmont CO, just 50 miles from Fort Collins where the
WWVB transmitter is. Sometimes our receiver looses WWVB phaselock!

Marty

I've got one!

But, you are right, I think......much lower production than the A model.

Now for REAL low production, how about a 535B??? To the best of my knowledge, there was only ONE ever made..... And to answer your next question....nope, I don't have it, but I know where it is! ;-)

Fun to see conversation about these old scopes. Best built there ever was. Period. My favorites are the 555, 556, 549 and 547. INCREDIBLE displays that make modern stuff look like it's out of focus..... And tunnel diode triggering that leaves TTL in the dust.

Cross-posted to:
rec.radio.amateur.antennas,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,news.admin.hierarchies,news.groups

I wish that I was the one to start these newsgroups. I'd have divided them up in better heirarchies like so:

To reduce the number of heirarchies in a newsgroup name instead of:

rec.radio.amateur.*

I would have made it:

rec.amateur-radio.

This is because discussions about scanners and broadcast radio and the like dont need nearly as many newsgroups as our hobby because our hobby is so much more diverse.

And for the *.antennas, *.equipment, *.homebrew, etc. I'd have made more spectrum-specific newsgroups to reduce the amount of unwanted posts we each have to comb through to find what we are looking for... Like so:

rec.amateur-radio.vlf-mf.*
rec.amateur-radio.hf.*
rec.amateur-radio.vhf.*
rec.amateur-radio.uhf.*
rec.amateur-radio.shf-ehf.*

And only for discussions on subjects such as the ARRL, the FCC, Newsline and all those which transcend all bands, only THEN you cut the NG name down to:

rec.amateur-radio.*

For example:

rec.amateur-radio.newsline

Speaking of which, why DOESN'T Newsline have it's own read-only newsgroup?

I have to go to FidoNet,(aka Fight-o-Nuts), to find Newsline online!
Phooey on Fido!

Sense of humor my ass!

I'm not so stupid as to believe that the "old war stories" that were posted in this thread were just "jokes". Until I spoke up it was obvious they were accounts of events. To defend it, even if it were a joke, is to show a blatent lack of care or respect for the hobby's image.

Admit it... You dont give a hoot if the general public sees ham radio as a valuable asset to humanity or not.

Fred,

I have the data sheets. I have generated a data library
for this tube (8283)for my Triode Ground Grid Program on
my web page at http://www.imaxx.net/~kd9jq The
program is TAP Version 2.0 and is now Freeware. This
is useable up to 2 Meters for RF circuit, higher if you
just need the design parameters.

If you still need the sheets I could scan it in and send it
as an OCR graphic file.

Source record: 98276

I need a little help on the Motorola Micor radio.

I have heard the 150-162 split Micor will go to the Ham band (146.70 Is what I'm looking for) but some have said it will tune down there, other have said it needs mods to work there? Anyone tell me for sure what I have to do to get it to work there?

On the Low band Micor, will the 47 MHz Split radio go up to 52 MHz?

Are the cables the same between the clam shell, and sys 90 control heads?

Is it the radio, or the sys 90 heads that decide if it can do scan, or the other sys 90 options?

Will the UHF version go to 440 MHz?

Thanks for the help

The other issue is that some other really simple and useful parts
(like Motorolas MC3363 one-chip NBFM receiver) are available ONLY in
the SMD package. I'd use it in a second if I could get it in a DIP,
but an amazing number of really simple parts like audio amps are now
appearing solely as SMD. This bodes ill, guys. That's why I'm
keeping my milk carton of tube sockets.

Joe Babe,

Get a grip. I am not a windows bigot. Since my wife programs for OS/2 applications, and I have been on the beta group since v1.2, it would be hard to be bigoted against it. I just accept the realities of the market place. By the way, its hard to smack of Aryian super race dogma when I'm Scot. So don't lose it when I suggest that OS/2 has lost and is not worth everyone's programming attention for hobby software. By the way I do use a OS/2 machine to run two scanners and my R8 at the same time, something that would choke Win95 but will be switching to NT4 as soon as I finish the program.

In under two years we will be posting about the downfall of MS and the rise of the next wonderful made for everyone OS and blaming gates&co on the same stupid things that we blamed on Akers and now big Lou for the marketing demise of Warp/Merlin.

Take care.

Mark

And, Plessey has dropped many products in their IC line that was extremely popular with homebrewers. I beleive the only US distributor that would handle onesy twosy orders for Plessey parts was DC Electronics. Motorola has discontinued their plastic RF power transistors. In 1969 you could call MHz Electronics and buy surplus crystal filters for USB, LSB or CW at bargain prices. Not any more. Parts suppliers have dried up and gone away.

>GpsRul@aol.com

Well;
On 2M, there is always the Table Mountain machine. It covers the entire upper desert area (and down into parts of the LA area). However, there are spots in Barstow that are kind of iffy. Barstow has a few repeaters, but being I never use them, I can't tell you much about them. There is a new repeater on Government Peak (wherever that is, me thinks near Ridgecrest) that does a good job in the desert, and the Bakersfield machines (linked) that do OK in the area you are asking about. I don't remember using any Victorville machines, so no comment. There is a Big Bear machine I use that does OK in the desert. I'm sure there are others, however, I pretty much stay on Table Mountain (member you know ;>)).

Now, for 220 or 440..... Email me (saving bandwith ;>)).....

Table Mountain :
WR6AZN 145.280- PL131.8

Gov Peak:
WA6YBN 145.340- PL100.0

Bakersfield (linked repeaters):
Bird Springs Pass:
WA6UYW 146.085+ NoPL
Bakersfield:
W6LIE 145.150- NoPL

Big Bear:
W6ZJU 147.330+ PL123.0

Hope this is some help, and hope to talk to you on Table on your way through.

Bob, KE6ZUF

Jay,

I built the 1208 (6m to 20m) which I am quite happy with. The RX is quite sensitive and I have not noticed any intermod. The kit is easy to build as long as you follow the instructions. Watch out for the tab on the driver transistor. It is easy to shot it to the coil can near by. I did and it burned a couple of PC board traces. The can now has PVC tape around it.

The transverter is quite robust otherwise. I have regularly pumped 100 watts RF into it (when I forgot to turn the power down after working HF), but the thing still works fine. The 8 watts is fine for sporadic E, but may be too little if you are going to use it for contesting. I have worked several stations across the continent without extra power. I use the AEA Halo antenna.

... snip all

OK, we have heard about the legalities, the reasons and everything else. Some of the realities are sometimes these illegal operators are causing a lot of harm. Let me tell a Story about a CB'er in the mid 70's who called himself EZ lovin.

This guy was running a really dirty station, causing TVI to telephones, business radios, hams, TV, stereo's, he came in everywhere in this small town.

Everyone knew who he was, contacting the FCC got them a pamplet on how to put bypass capacitors on their TV's.

Several times his coax was pinned, cut, power line feed cut etc. He always came back on in a day or two. Finally someone did indead build a jammer close to his location. Problem was solved, for a while he would still transmit, and pretend he was talking with someone, but he wasn't, and finally got tired of that, and gave up. I don't think any other method would have solved the problem, this guy was the spoiled brat son of one of the "city fathers", and was pretty much untouchable by locals.

I have considered the jamming method myself, but so far discussing the problem with the offenders has helped, but keep in mind the sunspot activity is very low right now, and most of the high power rigs are idle right now, just wait about 3 years. The reason I have considered the Jamming is all of my TVI complaints from neighbors have been CB operators, but since I have the big antenna they assume it is me.

I guess I would have to ask the reason the original poster wants to jam, a similar experience, or to get revenge on the neighbor for some possible real or perceived wrong. I suspect from the original post it is the latter, so I would not condone the action.

All in all I enjoyed the different methods, was a bit appauled by the spark gap idea though, and there was some humor. Although the other poster was correct it was supporting illegal activity reguardless of the reason.

I guess this is one of those area's where I don't have a black or white answer, but I do know when faced with someone running lots of power, who will not cooperate, killing their receive is the only way to get them off the air, none of the other tactics work, they just fix it, and start watching their station closely. The FCC won't help, unless they interfer with Police or medical there is not much chance of fixing the problem legally.

CB radio books cover VSWR if you are thinking of the additional
wire threaded through a short section of co-ax types. I think the
ARRL Handbooks also covered it.

908. Need help making telephone touch tones

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-24 00:00:00 UTC
From: Christopher McGill <mcgill@dseg.ti.com>
Message-ID: <32E90E0C.D1C@dseg.ti.com>
Source record: 98290

I need to be able to produce telephone touch tones for a home project which I am working on. Basically, I would like to know if anyone knows of a chip or circuit which could take the row and column lines from a telephone keypad and produce the two analog tones required to transmit a keypress. A long, long time ago (1989!) Radio Shack used to sell a telephone keypad/CMOS chip combination which would do the job. Motorola had a 2-of-8 tone encoder chip (MC14410DW) listed in their 1995 catalog just for this purpose, but nobody (even at Motorola) seems to know where to get this chip today. The current state seems to be entire phone systems on a single chip or chip set to which one supplies only a microprocessor and its associated RAM and ROM. All of this is overkill. I just need a 2-of-7 or 2-of-8 encoding circuit/chip to make touch tones; and, yes, they do have to be telephone system compatible. Any help would be greatly appreciated. Replies can be posted to this newsgroup or emailed to me at the address below.

Thanks,

Chris McGill

measures@mail.vcnet.com (R. L. Measures) writes:
>
>Mr. Rauch---FYI, on the Internet, 'IMO' is an abbreviation for 'in my
>opinion'. Is an opinion the same as a conclusion?

Please show me where your published documents state IMO. I can't find the
disclaimer that it is just an opinion.

>equipment, who, when the mood suits him, emits a rather impressive cloud
of
>conductive mist out of his stern end, that smells quite unlike Chanel
>Number Five®.

Thank you for sharing that important technical information. I don't
believe most normal people allow cats to whiz on their equipment, and then
publicly compare arcing cat urine to prefume.

> Why don't you ask David Holtcamp what I told him before and after he
<snip>
> Curiously, when Marvin made this
>clarification to me on the telephone,
<snip>

Richard, let's suppose your new story is factual or truthful. That being
the case, you posted things before having facts.

You go so far as to say things like "Marvin Born measured the parasitic in
an AL-1500 with a spectrum analyzer" and use that as an accusation against
my abilities or one of the typical Measure's slams on a manufacturer's
product. Yet now you admit you made a mistake, and misrepresented fact.

Rather than admitting you fibbed or intentionally changed data, you want
us to believe you just made a simple mistake and didn't have all the
facts. Same with the TL-922.

If you post conclusions, suggestions, and/or form opinions without having
heard the facts, how can we trust anything you say? Either we can trust
you to be accurate and thorough, or we can't. IMO, if we can't trust
everything a sole source presents, we can't trust anything presented by
that source.

Surely even you can see it makes no difference if your stories are
premature, an incorrect conclusion, or outright pathological lies. The
only thing that matters is the information presented is often wrong, and
you (for what ever reason) can't be trusted to supply accurate data. This
isn't just one or two things Rich, it's many items.

1.) The dissipation of an 8877 grid. It is not 500 watts in the Eimac data tables Rich.

2.) The failures of 8877's. Eimac did have a manufacturing problem in the 80's that you blamed on parasitics. You were caught on that one.

3.) Photons causing arcs. Even you admit QST couldn't be duped into printing that one.

4.) Your claim the peak tank voltage could never exceed the supply rail. You argued that point with Mario and lost.

5.) Your claim about Buzz Miklos' employment, and that Eimac released data to you. You were caught on that one.

6.) Your claim about the variacs and filament controls in BC transmitters. You were caught be several people telling that one.

7.) Your "opinion" about Dave's 922. You were caught on that one.

8.) Your early statements about Marv Born's measurements. You were caught on that one.

It's easy to find eight things that are untrue, claims you argued about and defended. The reason *why* you present false claims over and over doesn't matter. The bottom line is your claims can't be trusted.

Not the one I had.. the unit was modified to a non digital oscillation
at which time no longer worked with my RC.

not to mention, if someone has an RC car worth more than $69.95, they
sure as hell don't use 27 Mhz.

Jim..

Look Ted, I can see where you might be coming from but you also must realize that a VERY large number of CB'ers are running illegal amplifiers which are usually not filtered correctly for the frequencies they are used.

by getting just one of this type of CB'er OR HAM for that matter to ease off the key for just one day is worth this little prectical joke.

The device I made had a range or perhaps 100 meters and effected no one but the person who was destroying all modes of receiption in a one mile radius.

Jim.

Wayne...

Make them using some 1n1004 diodes in a stack. Use the appropriate diodes and 470 Kohn resistors on a vertical stack. Break open an 866 (look out for the Mercury) and then use some perfboard to build the diode stack. That is all the commerical guys to and then they pot it with potting compound. Cheap and easy

All of what you said is true above...but I would like to make some points here. I have the Ameritron AL80A which is one 3-500Z. I talked to the designer of the amp and he says you can use more current through the tube than the 400 MA on SSB. The facts are, that tube life of a thorated tungsten tube is based on filament voltage and emission, not plate current. The saturation point for a 3-500 from plate current is 2-amps!

Yes, watch the grid current, but you can load the thing up more than 400 ma... It is better to do this in SSB...and run 400 MA on CW.

The effective permeability of a rod is strongly dependent on the
physical size of the rod, rather than the material permeability.
eg for a rod of 200mm length, 10 mm diameter = length/diameter ratio
of 20, will have effective permeablity of roughly 20, regardless of
the material permeablity (until the material permeability gets
down close to 20).

Yeah... the least they could have done was to disguse their intent by asking instead how to make a QRP xmitter for a t-hunt. But like I told Rob, they don't CARE how they make other hams look. Sheesh! It's bad enough that Art Bell gets on talk-radio bragging about being a ham now and then while the rest of the time talking about seeing his black triangles! Art's got people thinking we a bunch of UFO kooks! Then there's hacker Kevin Midnick (sp?)

So I have to wonder... What's next? Maybe allegations about the Oklahoma City bombers being hams? Or maybe some idiot will start promoting that white supremacy net on 75M that meets on certain mornings? Maybe cult leaders like Jim Jones and David Koresh were hams too? What was Fidel Castro's callsign again? Sheesh! This hobby needs good PR enough as it is already without these carrot-waxers giving the rest of us a bad image!

Chiron: Don't feel bad! Most of the modern texts do a terrible job
of explaining how simple VSWR measuring equipment actually works.
These devices are very simple in their construction, but understanding
their function requires some study of the physics involved.

Take a look at the February issue of the American magazine "73 "
There is an article there. Also, see if you can get someone in a
local amateur radio club to provide you with the August 1965 issue of
QST magazine. I know this may be difficult where you are. Let me
know if you need help.

Kyle,
I recommend you wander over to the TENTEC web site and use their
E-Mail capability to order a catalog. Browse the site while you
are there. They have a line called T-Kits which includes some
decent receivers and Ham rigs for the beginner. May take a little
intro to electronics and soldering practice before you get started.

http://www.tentec.com

Also, look over the ARRL web site for organizations and clubs near
you that might help you select a good kit to start with.

http://www.arrl.org

Good Luck - - Dave K7HMP

P.S.

There are several other kit companies around, but I've been impressed
by the quality of the TenTec kits and equipment.

Bart:
I doubt that you will find a diagram for an "Amateur" transmitter that will cover that complete range of frequencies - and stay in compliance with NZ rules and regulations. It is possible that there might be a military surplus rig that covered the range? For the closest ham band check some of the older (Pre-1970 +/-) ARRL or RSGB handbooks and magazines
for rigs in the 160 M ("Top Band") frequency range 1.8-2.0 MHz. There are also the occasional Part 15 (very low power) rigs for the broadcast band - but they have some additional constraints (ant & power). Search around for Part 15 and or Pirate Radio web sites.

Have Fun / Stay Legal
I've heard terrible things about those Down Under prison colonies ;-}

Cheers es 73 Dave K7HMP

Hi Ted:

Normally I'd not waste NG space but since you forbid me to send e-mail
to your address.
Ted, your nothing more than a troll, I see you've spammed this garbage
post to all the ham groups.

What is it that you want Ted? Someone to agree with you? Someone to
argue with? Your last post requesting info on a yagi antenna was a real
treat. You chewed out everone who responded! Take your little troll
posts and head on over to alt.flame your sure to find lots of
interesting people like yourself there.

> already without these carrot-waxers giving the rest of us a bad image!

Jim Jones was not, but he did make regular 20m transmissions from the
camp via an amateur in his group. I worked him and recieved a QSL card,
it had several pictures of the campsite on the front. The amateur took
his life along with the others about 5 months later.

Speaking of PR Ted, what image do you leave with newcommers reading your
posts? Someone offers to help you with an antenna problem and you pitch
a fit because they didn't do it the way you wanted. I'm sure YOURE
responces made the newcommers want to jump right in.

While YOU'VE been bitching about the rest of us what have YOU done to
promote the hobby in positive manner? I really love the part where you
keep your anonymity, if your going to make a statement Teddy, right or
wrong, sign your name to it. It doesn't mean much without it.

Soon I'm going to be installing an audiopatch on my mobile radio in the house. Rather than use the 8-pin connector on front, it'd be much more convenient to use the 2 jacks in the back intended for packet. The main question is, are the audio in/out & ptt connections in back equivalent to the front conncetor and the external speaker jack? The instruction book says "The PTT control through the rear jack is solely for packet use only, and may not exhibit the same characteristics as the microphone PTT".... To me it seems like it would work the same... any input? Please email replies back to me. Thanks in advance.

>Thanks, Brett

Yes Brett, it has been done.

There was a excellent article written a few years back in
"QEX". The project utilized power FETs and toroid transformers.
The power supply operated off 220V and gave in the area of 3KV
at 1 amp to power a 3-500Z. Let me know if you find the exact
month and year of this article, I would also like to ge a reprint!

Hello Chiron,

A good book that you can find information about it is "The Radio
Amateur's Handbook" that there is a chapter that tells everything about
"Test Equipament". I think that you can find a schematics to build your
own VSWR!
Regards
Marcos

I am asking this question for my husband who has just completed making his first batch from a kit we bought in the wireless catalog for Christmas. He is hooked!

He would like to know if you can use a 7.5 gallon carboy to rack off 2 gallons of beer? The kit has all of the equipment (except a place to rack off) for 2 gallons. He knows that he would like to expand soon to making 5 gallons at a time and he does not want to invest in two different size carboys.

Any help would be appreciated!

After building a couple simple DC and superhet receivers I am wondering what must be done for AM reception? Someone said increase the gain of the LO going to the mixer, is that correct?

Would someone kindly explain the difference in the audio portion of the reciever.

Use of an autopatch on a home station falls into the same rules as a rptr autopatch...you MUST have remote control of the station (either wireline OR RF ABOVE 222.15 Mhz), it MUST ID properly at 10 min intervals when in use, and a control op MUST be present at the control point when it is in use....
> packet. The main question is, are the audio in/out & ptt connections
> in back equivalent to the front conncetor and the external speaker

> would work the same... any input? Please email replies back to me.
> Thanks in advance.

The packet PTT may have a short timeout timer built into it.....I doubt it but it seems the manual seems to indicate this...what rig is it and what is your callsign??

> (Well, Cecil still does, but he's the only one I know of.)

Hi Roy, actually I take the ratio of Imax to Imin to obtain the SWR on my ladder-line. However, I think I understand how the average SWR meter works. With a capacitive divider across the conductors, it yields a voltage proportional to the T-line voltage. With a conductor running through a toroidal pickup it yields a voltage proportional to the T-line current. Since by definition, the forward voltage is in phase with the forward current and the reflected voltage is 180 degrees out of phase with the reflected current, then the forward power is V*I*Cos(theta) and the reflected power is V*-I*cos(theta) assuming the SWR meter has been calibrated such that the voltage proportional to the voltage and the voltage proportional to the current are equal for a characteristic impedance of Z0 and load of Z0 ohms.

This is easy to do for unbalanced lines. However, for balanced lines, one cannot assume that the currents in the lines are the same because of common mode currents. (Same problem can exist in unbalanced lines with braid currents).

Why in the heck can't I buy a 300 ohm or 450 ohm balanced SWR meter?

>

{snip}

Ya but...

I think you can always match the impedance that the device wants to
"see"
for optimum NF to 50 ohms and get a 1:1 VSWR. The cruddy VSWR is not
necessity for low noise. The problem is that the GaAsFETS that are
used for this purpose are frequently unstable when matched in this
configuration. Hence a little bit of the noise figure is traded for
a good bit of stability by mismatching the device.

BTW, there are other methods of enhancing stability without causing
a poor match to the source and load.

Hi,
Hass anyone had any experience with making crystal sets using
germanium diodes for VHF bands? I am interested in knowing if it is
possible to use a germanium diode crystal radio to pickup airband signals.
I have very vague memories of a kid at school owning a pen sized
airband receiver.
If it is possible can I just use the standard crystal radio design but
alter the LC circuit to the frequencies of choice?

Best Wishes,
Henry Titchen.

For Sale,
Hamtronics Repeater Controller with AP3 Phone Patch. All in good condition. All you need is a simple transmitter and receiver. The controller also has a port for an auxilary receiver, good for linking to another repeater. This controller was factory built, not a kit. Comes complete with owners manual. Price is $200 shipped.

NO!

That is way too much airspace above the beer. It will oxidize in no
time. Use the proper carboy for the proper amount of beer.......
just spend the money in getting the correct size carboy, or you
can waste your money on oxided beer.

my 2 cents

Not according to Eimac. Are you more inclined to believe the designer of
the tube---or to believe a person who refered to himself as a recognized
'amplifier expert' in a letter to QST magazine [9/94, p.71]?

>The facts are, that tube life of a
> thorated tungsten tube is based on filament voltage and emission, not
> plate current.

It is true that the issue is not tube life. The issues are rotten splatter
and rotten advice from a self-recognized 'expert'.

> The saturation point for a 3-500 from plate current is
> 2-amps!

According to Eimac's characteristic curves for the 3-500Z, above a peak
anode/'plate' current of about 1.3 amps, the 3-500Z becomes progressively
less and less linear. 1.3 peak amps corresponds to an anode current of
about 400mA.

> Yes, watch the grid current, but you can load the thing up more than 400
> ma... It is better to do this in SSB...and run 400 MA on CW.

>Greetings and thanks in advance

As Wes Hayward pointed out to me just the other day, we seldom actually measure VSWR directly any more. (Well, Cecil still does, but he's the only one I know of.) Slotted lines are no longer in general use. More often we measure reflection coefficient and calculate VSWR or return loss from it. So you might look in textbooks for the topics "return loss" or "reflection coefficient". Two books I can recommend are _Introduction to Radio Frequency Design_ by Wes Hayward, now being reprinted by the ARRL; and _Solid State Design for the Radio Amateur_ by Wes Hayward and Doug DeMaw. It's also an ARRL publication (still in print, I hope).

Paul,

I have built both. In my opinion, the Ten-Tec is *much* better. The Hamtronics kit was not great on the RX side. The sensitivity was poor and it had a tendency to oscillate.

The Ten-Tec kit has a decent receiver and furthermore, it has a built-in TX/TX switch. Using 20 as the IF, on the other hand, has the disadvantage that you are only able to work on a limited part of the band. The advantage is that you can now use another transverter (say 144 or 222 MHz) at the same time.

986. SSB filter / IF amp using opamps

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-26 00:00:00 UTC
From: maroof@cybersys.net
Message-ID: <5ceuqmfgh1@post.servtech.com>
Source record: 98120
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Has anyone tried to build IF amp NB filters with general purpose / high frq opamps (like TL071, CA3130)?

I tried making a narrowband active SSB filter with TL071. used a 455KHz ceramic resonator int the noninv amp feed back loop, (replaced the feedback bypass cpacitor with the resonator). The result was, a very high Q filter around 455KHz (certainly many times higher than the resonator) with about 28dB gain. Don't have a frq counter, so can't find actual cutoff frq. Do you think this would work well in Tx/Rx IF system?

Trying to eliminate complex tuning / coupling networks in IF systems with easy to build & couple blocks. (like the good old SL6xx chips). Anyone interested? Please help.

Thanks for reading.

Don't forget that you can buy "spreaders" to mount SMD chips on a 0.1in
DIL pin header. For UK readers they're in the Farnell catalogue; could
somebody please re-post details of a US distributor?

Unfortunately they're expensive for such small and simple items.
It would be a real public service if somebody could offer the
electronics homebrew community a board containing a selection of say 20
pre-etched SMD spreaders in different sizes, etched but un-drilled, so
we could cut out just the ones we need.

With a static hot air source and solder paste, SMD is easier
than DIP. The Weller Pyropen Jr makes an excellent static hot air
source which is inexpensive and cordless. It is simply amazing to
watch the tiny parts align themselves when you give them a shot of
hot air. The surface tension of the melted solder paste on the pads
literally pulls the part into perfect alignment. No muss, no fuss.

The very fine soldering iron tips can be a problem. They don't have
enough mass for good heat flow, so it takes too long to make a joint.
That allows time for heat to migrate up into the chip. If you solder
the pins one immediately after the other, you can exceed the chip's
temperature limits before you're done. With the static hot air, one
quick shot gets all the pins at once, and heat doesn't have time to
migrate inside the chip.

The pitch of the pins is also pretty much irrelevant when using the
static hot air source. Solder bridging is controlled by the amount
of solder paste you apply to each pad. With a little practice, you
learn how much is enough, and how much is too much. I use a sharp
wooden toothpick to apply the paste. This is the most tedious part
of the procedure, and I use an 8x jeweler's loupe to make sure I

put the paste squarely on the pad. Then you just set the part roughly in place with a pair of tweezers and hit it with the hot air. It will self-align perfectly due to the surface tension of the melted solder.

The only problem I've had is getting solder paste at a reasonable price. Only one local vendor carries it in stock, and he wants an arm and a leg for a small syringe of it. I've had to order it in bulk from an industrial supplier to get a decent price. The stuff has to be refrigerated if you're going to store it for a long time. (I assume that's to keep the lead/tin alloy from settling out of suspension by keeping the flux binder stiff.)

I don't know how solder paste is made. I assume it is lead/tin alloy powder in a water based flux suspension. I wonder if we could mix up our own in an old blender. Anybody know how this stuff is made?

Very high Q doesn't always mean you have a bandwidth that will do
you any good or that the bandwidth is flat across the top.

You need to build a simple signal generator so you can look at
the bandwidth in detail. If you had a 'scope, you could build a simple
"sweeper" to make the job even easier.

I hope you find what you want Steve, but have you realised that you are expecting near crystal oscillator level performance from a VCO.

It would need a very tight filter bandwidth to get very much better than -107dBc at 10kHz although it is possible.

If you do find it you will have to pay well for the result, unless you design it yourself of-course.

Good luck with the search.

Bob.

From Bob G4EIK
A better way is to try connecting up your loopstick antenna with its capacitor etc connected and try to find the resonance with a gate dip oscillator if you have one as this avoids any chance of loading errors from your measuring bridge as the circuit is quite a high impedance.

Your idea of using your signal generator is quite a good one. If you don't have a gate dipper, make a small coil of wire linked between the inner and outer of your sig-gen output and hold this a few inches from your antenna, the signal should easily be heard. If you then try tack soldering extra capacitors across the resonating capacitor it should be possible to find the resonant point of the system, if your original measurement was right try with lower values.

Most standard ferrites for domestic radio antennas should be ok at 60kHz

I am sorry if the above is obvious to you and you have already done it. I hope you get it to work. I built a 60kHz rx years ago and use it regularly with some software written by G4MSV to decode MSF in the UK, it then puts the PC clock right.

Don't hack down the trees, at 60kHz They are unlikely to be a problem

If I buy a digital spred spectrum phone, and I phone someone who takes the call on either a cell phone or a 46-49 mhz cordless, will the conversation be picked up by a scanner, eventhough I am sending a digital signal?
If so, there is no such thing as a private conversation, until someone invents a pre-scanning device incorporated in the phone, that like call display tells you what type of phone you just connected too. There probably is a big market for such a device....If anyone markets such a device after to-day's date be prepared to share Revenues with me.

I would suspect unless you control the feedback level, the dynamic
range will be severely limited precluding its usefulness on SSB
signals.

I don't think so. A mediocre crystal oscillator will do -140
and a state of the art one with do -180.

>It would need a very tight filter bandwidth to get very much better than
>-107dBc at 10kHz although it is possible.

As I said, we did considerably better than that at Konel 20 years
ago by 1) tapping way down on the tank so the amplifier didn't
de-Q the tank and 2) keeping the gain down which raises the
signal to noise ratio at the input of the transistor. The Konel
KR-78 didn't have a very high Q tank, just a low impedance one.
Knowing what I know now, I could probably get another 10 dB.
without doing anything heroic. Just go thru Leeson's or Edson's
equations, and do what optimizes phase noise: high loaded Q and
high drive level to the input of the transistor. If you go to a
really high Q tank like the HP 8640, then you're looking at -130
to -140 at 10 kHz., and that was designed 25 years ago.

1006. Re: 6m duplexers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-26 00:00:00 UTC
From: kc6ovd@aol.com
Message-ID: <19970126202901.PAA16395@ladder01.news.aol.com>
Source record: 98140

A fine set of duplexers can be made for about 50.00 bucks! Or even less if you have a well stocked junk box. All you need are a bunch of coffee cans! some copper pipe aluminum plate ans a 150pf air tunnable cap. you will need to make 4 of these. The coffe cans will make a nice set of cans. I have a set on a repeter now each can has about 22db of notch with .5db pass loss.

Do not be fooled building cavities is fun and very simple. Once you become familiar with how they work. I have made a set with 8" aluminum irigation pipe and all the same hardware as with the coffee cans and have 35 db notch with them. I have not put any drawings together but I will try to get something done up in the future to send out to all. If you are near the Bakersfield area of Ca. I would be more than happy to show you how I have built the ones I have and show you working models of them.

Remember Ham Radio was founded on building and experimentation. So please try your hand at it.

conversation
> be picked up by a scanner, eventhough I am sending a digital signal?

The converation could be monitored by a scanner in the area of the 46-49
phone,
assuming that the 46-40 phone has no scrambler or that the snooper is
sophistocated enough to unscramble the scrambled signal.

The digital spread spectrum phone is nominally *harder* to snoop on than
the
46-60 phone, but "spread spectrum" does NOT equal "secure" ... there is a
difference between PN codes used for spreading and "cryptographic" codes
which are used to provide security, however, many people seem to
erroneously
equate the two.

> If so, there is no such thing as a private conversation, until someone
> invents a pre-scanning device incorporated in the phone, that like call
> display tells you what type of phone you just connected too.

Short of systems which would employ true, powerful cryptographic data
security
techniques, there is no such thing as a (guaranteed) private phone call,
even on
a wired phone ...

>There
> probably is a big market for such a device....If anyone markets such a
> device after to-day's date be prepared to share Revenues with me.

On what basis? Surely you jest in implying that you've conceived of
something
novel here????

Who would help me ?

I'm intrested in everything about ACARS
I have found a schematic to build a ACARS interface. I can't test the interface because i don't have the program to decode them.

Who would like to send me decoder software via email ? (something like LOWE)

I'ts above my budget to buy a LOWE interface with the software, if i could test my interface i could affort it.

So to all spotters, radio amateurs... who send me software to decode ACARS (maybe there is schareware to decode them ?)

If you have any other suggestions to help me and it's about the ACAR system, be free to email them.

THANKS VERY MUCH !!!!

>Hi Roy, actually I take the ratio of Imax to Imin to obtain the SWR on my
>ladder-line.

This is direct measurement and calculation of ISWR, which is numerically
the same as VSWR, commonly referred to as SWR. (I know you know this, but
some readers might not.)

>. . .

>Why in the heck can't I buy a 300 ohm or 450 ohm balanced SWR meter?

Maybe because people use 300 or 450 ohm line so they won't have to care
what the SWR is?

Seriously, if people could measure the SWR on these lines, it would take on
the same importance now given to SWR on coax. And for the same reason
-- because they could measure it. Just think of all those people spending
hours and hours getting the SWR down to 1:1 on their ladder lines so they
could get out better, like they do now with coax. An SWR meter for ladder
line sounds like a great opportunity for someone who wants to make a lot of
money and who has a cynical streak. Hmmm. . .

Sounds regenerative...

{snip]

> I'm interrested to know about Q multipliers, what's the general configuration
> & how does it work. Can the ckt described above be working like a Q
> multiplier?

A Q multiplier relies on the fact that an amplifier that is regenerative
and
is on the verge of oscillation appears to have a higher Q than the same
circuit
that is not near oscillation. The Q increase is a direct result of the
positive feedback. If I remember, the amplifiers had a 'quench' knob
that allowed the
feedback to be varied. Too much feedback caused the amplifier to
oscillate.
Neat idea, but definiately was a high usage adjustment.

> Since the filter is intended for IF applications, is there anything special to
> be taken into consideration? Most IF amps (in IC form) are simple differential
> amps. Whay aren't opamps popular as IF amps, any specific disadvantage of

The AD603 and brothers for Analog Devices are examples and have
linear-dB
gain control. Even better for for IF amplifiers.

Hello Jim:
I have built systems up to 25mhz using opamps for filter/amps. These were SSB and AM systems. You should look into the Linear Tech LT1259 and LT1260 video opamps. These things are incredible. Some are incredibly linear, and fast (1600v/us slew, if I remember right) up to over 100mhz. They are current feedback, and can be used as a filter/amplifier combo. Since most active filter programs limit the frequencies to audio, I wrote my own to cover higher RF. The formulas work at these high frequencies!

In short, opamps used in active filter/amplifiers work great!

Check out the surplus stores around for used test equipment. If you are playing in RF with this stuff, you need a spectrum analyzer, signal generator, and scope, at least. You can get older equipment pretty inexpensively this way.

Source record: 98011

Randy,

Take a look at Motorola's Appllication Note for their 600 W FET Amp using four paralleled devices (MRF150). Their 3rd order IMD performance wasn't all that outstanding. Does anyone have more recent results? BTW, the MRF150s cost more than 811As, although I agree that the solid state design has advantages in the power supply.

High power bipolar seemingly requires either a lot of combiners to sum up the output (one can't easily parallel bipolar devices) or low power gain. The
higher power devices in my literature seem limited to about 10 dB; an amplifier constructed from these would deliver less than 10 dB of gain after
input/output/filter losses: a 100W transceiver wouldn't drive a single stage
to capacity.

The hi-mu triodes (887X and 3CX*) still look attractive!

I got the list, but I have no idea what all the things are.

I would like a nav/com (tx does not need to work) with excellent rx.

Also I would like a fully functional VOR setup with indicator. May
be add-on to above.

I prefer transistor, but I could deal with some tubes as the setup
would be line powered.

Obviously synthesized is better.

What do you have?

Very nice response to a simple mistake! Seems like a lot of amateurs are out for blood. I hope that the net surfing public doesn't look at this post or the crap on rec.radio.amateur.misc. Certainly doesn't leave a good impression. Maybe some of the people who flamed this person should go spend some more time behind their radio's instead of their keyboards.

...stuff deleted...

If you want a pretty good VCO for low phase noise check out ZCOMM
at http://www.zcomm.com. They make VCOs from 50 MHz to 3.5 GHz in
0.5" square packages that work very well. I have been using them
for microwave synthesizers for the last few years. I recently designed
a 1-1.1 GHz synth that steps in 250 KHz increments that produced better
than 105 dBc phase noise at 10 KHz. This is plenty clean for our
digital radios.

That's what I'm trying to find out. I can't find the shape factor without a
freq counter. If anyone tried anything similar then I could maybe use the
information for further mods.

> You need to build a simple signal generator so you can look at
>the bandwidth in detail. If you had a 'scope, you could build a simple
>"sweeper" to make the job even easier.

Thanks for the advice.
I used an RF signal generator and a dual trace oscilloscpe to find the
response chareceristics of the filter. I 'swept' the frequency alright but the
filter passband was so narrow that I couldn't measure the frequency difference
at -3dB, using the scope. I need a freq counter to measure the smalll change
in freq.

I'm interrested to know about Q multipliers, what's the general configuration
& how does it work. Can the ckt described above be working like a Q
multiplier?
Since the filter is intended for IF applications, is there anything special to
be taken into consideration? Most IF amps (in IC form) are simple differential
amps. Whay aren't opamps popular as IF amps, any specific disadvantage of
opamps in this application?

Thanks for reading the mail. Looking forward to your advice.

effort!

1045. TWT Power Supply

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-27 00:00:00 UTC
From: "Paul C. Barnes" <cribbage@ix.netcom.com>
Message-ID: <5cif84$9fp@dfw-ixnews10.ix.netcom.com>
Source record: 98077

I have a ham friend who is trying to build a TWT power supply. He has it with 12 volt d.c. in and 110 V 400hz a.c. out. He says that the supply he built work o.k. at .5 amps, but when he tries to draw 5 amps it drops down drastically in voltage. I suggested he needed to feed back from the output to the oscillator that was doing the chopping and increase the duty cycle. I don't know how he is doing it, but I told him I would ask here and see if anyone had any ideas, schematics for good power supplies or the such.

Thanks, Paul W4YRL

Money? Try this...
****
***
This is the $1.00 concept explained without the hype and silly numbers!
This is an honest and legitimate way of making money on a regular
basis. Read the following carefully and you could be joining the many
thousands of Internet users who are currently earning quite large sums
of money with a few hours work using their computers via the Internet!
****
***

This posting has been appearing for quite some time and has now
literally got thousands of people actively involved. No doubt like me,
you may have seen it before and become a little confused by the way it's
been explained. However, I personally have never believed in a so
called "Free Lunch" and have always worked hard to support my family.
But this idea is so simple involving a modest $5.00 investment that I
simply had to try it. With so many people involved I became convinced
that I too could benefit. And, as I found out, this system really does
work!

After about two weeks in, I'm beginning to get a reasonable and
realistic return with a further understanding of just how big this
concept really is. Money is coming in from all over the world!

If you're interested there are three basic steps, all of which are
pretty simple.

THE FIRST STEP (1).

Take five sheets of paper. Write your name and address on each piece
along with the words: "Please place me on your mailing list". Take each
piece of paper, put them in an envelope along with a one dollar bill
inside and mail them to the five names listed below. *NOTE: By asking
to be placed on each person's mailing list you are in fact paying for a
service that consists of using the Internet to advertise a business
dealing with assembling a mailing list of people who are interested in
working from home using their computers to generate an income.

Mail to:

1. T. Graff, 105 Del Villa Dr. N.E., Salem, OR 97302 USA

2. C. T. Todd 2866 Lexington Trace, Marietta, Ga. 30062-4345, U.S.A

3. B.A. P.O. Box 5482, St. Augustine, FL 32085-5482, USA

4. B.M. Day 6215 South Shore Drive, Leo, IN 46765, USA

5. A.K. Panhorst, 90 Pond St., Cabot AR 72023, USA

When you have mailed your message and one dollar bill **(Please don't send checks or money orders)** to the above people go to the second step:

SECOND STEP (2).

Remove the top name and address from the above list and insert your own in the number 5 position. This can be done simply by amending the address section with no other alterations and posting as described later, or you can retype the whole document adding information you feel may be important.

HERE IS WHY THE SYSTEM IS SO SUCCESSFUL!!!

As you probably are aware, the Internet is growing daily at a phenomenal rate, doubling every year. With literally millions and millions of people surfing the Net there is the potential for tremendous exposure. With nearly 20,000 Newsgroups to post to and hundreds of thousands of people dialing in to them every day, if done correctly this program can't help but be successful.

THIRD STEP (3).

Post this message with your name in the number 5 slot to at least 250 newsgroups. There are at least 17000 newsgroups at any given moment in time. Out of every block of 200 posts I made, I got back 5 responses. Yes, thats right,only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5. Not a large sum...but wait...

Each additional person who sent you $1.00 now also makes 200 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

Now these 50 new people will make 200 postings each with your name at #3 or 10,000 postings. Average return, 500 people= $500. They make 200 postings each with your name at #2= 100,000 postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 200 postings each with your name at #1 and you get a return of $50,000 before your name drops off the list.And that's only if everyone down the line makes only 200 postings each! Your total income before your name drops off the list is $55,000.

From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again. For a better return post to more than 250 newsgroups initially.

The end result depends on you. You must follow through and repost this article everywhere you can think of.

GENERAL STEPS ON AUTOMATING THE PROCESS:

Make any necessary changes to this article as explained in step (2) and when you're done save it to your word processor. Then click on Copy.

Next, locate the newsgroups you intend to post to (Netscape 3.0 is terrific for this because you can highlight dozens of newsgroups all at once, enabling you to distribute your message to 1,000s of locations in less than an hour or two). Highlight all the newsgroups you want to post to, which is done by holding down CTRL while clicking your left mouse button. This way you can select multiple newsgroups in one go. Then after highlighting the newsgroups, click on "To News". Place a sensible title in the "Subject" location, click on the text section, go to the Edit menu and click "paste" Click on send...and that's it.

Repeat the process over and over again be selecting further newsgroups in multiples of 10s, but try to be selective with the groups by posting to high volume locations, and don't choose a subject that appears too flashy, as this will only put people off.

1048. FS: HP DC to 4GHz coax relay

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-27 00:00:00 UTC
From: George Keller <gakeller@worldnet.att.net>

I am in need of a IC for a Motorola Moxy 150 Mhz radio. I have contacted the Motorola service rep. in my area and I keep getting the runaround each time I speak to them. I have been trying since May of last year to get this IC and usually I hear that "I'm sorry we forgot to order it for you" or "I lost the numbers you gave me". If someone has the ability to order this for me please let me know.

It is the desc. IC with the following numbers on it "M2078" and "274 H 8436". I have tried to cross this to another number but have had no sucess.

Please do not take me wrong I am not bashing Motorola, just tried of not geting the part that I needed.

1053. Pse help w/SNELGROVE filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-27 00:00:00 UTC
From: yo3ctk@alltrom.ro
Message-ID: <01BC0C85.7CD8D4E0@mihai.alltrom>
Source record: 98085

Hi everybody !

I would like to enlist your help in finding specifications for a crystal =
filter manufactured by SNELGROVE Co. Ltd in Don Mills, Ontario. Model =
number is:
F 1500-1L
It seems to be a LSB filter with 1.500 MHz carrier frequency but I am =
unable to find proper termination impedances or other characteristics as =
insertion loss, bandwidth, stop band attenuation and in-band ripple. My =
attempts to locate this company proved fruitless, as it seems that they =
are out of business. Apparently, there is a company with this name in =
Don Mills, but is involved in real estate (!) business.

Any help ? Thank you all.

The email attacks on Diane Moore for her beer question were unwarranted and reveal some pretty ugly character flaws on the part of the originators. Unless you can enforce a single meaning worldwide for the word "homebrew", you'd better be prepared for similar intrusions of your precious group in the future. After the treatment she received here, I pity the next ham who wants to put up a tower in *her* neighborhood!

One word RELAX! all of you are on the fast track to the grave. My
opinion is look for the positive.(Nothing positive about jamming) quit
bashing the No Codes, help them out with code, maybe if it wasn't shoved
down their mouthes, everyone fair better. Be an Elmer, make someone's day.
I'm sure everyone of us has something positive to share. I was ready to
give up my ticket, never get the code, and toss my radios in the trash.
Until field day, now I have the HF itch. Someone else showed me QRP, let
me tell you. The fever is alive and feeding the code, aleast for me.
Practice good form on the air, 1st timers are looking for a role model.
With the exception of part 97 everthing else is a "gentleman's agreement"
no gentlemen, no agreement. No offense to the YL/XYLs intended.
Think of something you can do to make a positive change. ie. I didn't
know Q-codes are not used on FM uhf/vhf until I was elmered.

Gday Tim

A direct conversion receiver has a problem with AM reception in that
the carrier of the AM signal and the local oscillator must be
"exactly" synchronized or a beat note will result. Also the audio of
the AM carrier will be frequency shifted by any error, one sideband up
and the other down. This gives more difference products and the result
is a mess. One possible answer is a synchronous detector where the
receiver local oscillator is phase locked to the AM cariier but this
results in added complexity.

You might check out the latest QST... there was an article in there on
someone's homebrew controller. Seemed to have some pretty decent features,
and was based on one of the PIC microcontrollers. Source code was available
on the net, as is the manual, etc. for it. A partial kit was available for
$30 + ship, and included the u-processor and a couple of odd IC's. All
other parts were available from Digikey, I believe.
Anyway, I've ordered one, but haven't got it yet. If you're interested, I
do have the designer's e-mail address (I'd post it, but I don't know it
off the top o' my head :-)) or I can let you know how it goes together
when I get it. Hope it helps!

>Craig, AA3MD

My 250 Watt Johnson Matchbox works fine on the WARC bands with no mods.
My antenna is a 102 ft. dipole fed with 400 ohm slotted line.

WARC band - tuner bandswitch
30M - 40
17M - 20
12M - 15

I had to trim my feedline for best match between 40M and 30M.
However, the Matchbox will not tune 160M.

Your mileage may vary.

>diameter #33 ferrite core. The coil is single layer and about 4.5
>inches in length. If I did the math properly, I get an effective
>permeability of only 45 or so.

I am planning on checking out the exact formula, but a short coil on
a long rod gives a higher effective permeability than a long coil. The
curves I have seen give the effective perm as a function of
(coil length)/(rod length). You can get an intuitive feel that for
a really short coill on a really long rod, the effective perm wouild
get closer the material perm.

>Using this value, the predicted and actual values of available voltage
>are very close.

Excellent follow-up. Thanks.

DEVICE CONTROL APPLICATION NOTE

We are pleased to announce that our new application note,
'Device Control via the PC' is finally available.

This application note covers such topics as PC control of lamps and motors
using solid state and mechanical relays, device control using both
BJT and power MOSFET transistors, stepper motor control using a transistor
array IC, as well as PWM motor control using the L293 H-Bridge. Connection
to the PC is made via our inexpensive EDE300 PC Interface IC. Code examples
are also provided.

Feel free to download a copy today; it is available at
http://www.netins.net/showcase/elab in the 'Integrated Circuits' section
under 'EDE300'.

Well, try this, and figure out what to call it...
Turn on computer with WIN 95 loaded. As soon as machine starts to boot,
press F8. Select command line mode. Welcome to DOS (7?, WIN 95 DOS??).
Acts alot like DOS 7. Now type WIN. WIN 95 comes up, acts the same as
always.

You might check the Winter 1996 issue of Communications Quarterly. On page 29, there's an article by Ulrich Rohde and Chao-Ren Chang entitled "Osicllators with Low Phase Noise and Power Consumption". Apparently it's a reprint from RF Design. It might be a starting point.

Michael VE2BVW

On 20 Jan 1997, Tom Bruhns wrote:

Source record: 97916

It's not that simple. You can't just drop a VCO into
the crystal socket. However, from a functional standpoint,
you can use a VCO (with accompanying PLL, control, and
buffer amp circuitry) to replace a crystal-controlled frequency
source or a VFO (variable frequency oscillator) used for
frequency control.

Mini-Circuits has a short publication called "VCO Designer's Handbook"
that is the best FREE description of VCOs I've seen.

I just talked to the local Newark Electronics rep this morning and they are sending out the latest copies of both catalogs. Mine were a year old.

Keep trying and ask and they should send it. I beleive that a new Farnell catalog is coming soon. The rep said that Farnell bought Newark and they plan on keeping both catalogs.

I just ran across this discussion and have no expertice on the subject. However it occured to me that the reason for the arcing occuring was because the switch was thrown. The impedances could really be momentarily messed up during this short time and cause conditions to occur that bring about oscillations. Very high rf current flow when the contacts break contact could be the source.

If I'm completely off base let me know kindly please.

They are germanium, but ft is around 5, not 50 MHz. They were widely used
as switches in digital circuits. You probably have the remains of an early
digital computer. (If they had had 2N404's, it would have been a really
early one. . .)

Hi,

Sorry about my limited knowledge. I thought a spread spectrum phone uses
digital code division multiple access (CDMA). The continous voice
conversation was being first Pulse code converted then, depends on the
current instantaneous psuedo noise signal, each divided part digital
voice signal was modulated using shift keying method and so each part
have a different shift key frequency. The only way to decode the
information is when the receiving hand set to run the psuedo noise
sequence simultaneously.
So I am a bit unsure , and would most wish to know, how a analogue
scanner can intercept the conversion.
Information on this subject is most appreciated

My proposal for best ssb noise is as follows;
Build a single coil helical resonator at the required frequency (rather big at your frequency) optimise input and output loops /taps for minimum loss (2db?), Build bipolar maintaining oscillator with just enough Varicap to tune over the range, introduce emitter negative feedback extending down to DC employ a modest ft transistor with reasonable die area say a medium power device. Arrange vco configuration so that coil is grounded (single ended) take output across impedance at the earthy end of the coil.
Note noise floor primarily a function of the ratio of osc level versus device noise can be partly due to audio noise.
Close in noise a function of Q hence helical resonator gives best result if you can get enough tuning.

> 73, Harry, W3IIT

The Kenwood Service Dept in Compton, California used to tell TL-922
owners' whose bandswitches arced and burned up, that the arcing was caused
by rapidly switching the bandswitch back and forth while transmitting.
This would be like Chrysler telling minivan owners' whose transmissions
failed that the failure was caused by rapidly shifting back and forth
between gears while travelling at highway speed.

To the best of my knowledge, bandswitch contact-arcing always occurs across
open contacts. For example, in Rick (KC0HH) May's two, toasted, AL-80
bandswitches shown in Figure 15 at
http://www.vcnet.com/measures/
the amplifier was solely being used on 75m when bandswitches #1 and #2
arced and burned up their 10m and 15m contacts. When bandswitch #3
started arcing, Rick realized that something peculiar was going on. Rick
reported that the arcing ceased after he modified the VHF-suppression
circuitry in the amplfiier.

IMO, 10m and 15m contact arcing in a bandswitch is indicative of
intermittent VHF parasitic oscillation---especially when another indicator
is found, such a VHF parasitic-suppressor resistor that measures more than
double its marked value of R.
On page 33 of "Parasitics Revisited" in the October 1990 issue of QST,
the 10m and 15m contacts have literally evaporated from the TL-922
bandswitch. The replacement bandswitch in this TL-922 continued to arc
until the beautiful silver-plated Trio-Kenwood VHF suppressors were
replaced with ugly, but lossy, Ni-Cr-Fe VHF suppressors.

> -- proud members of the CQ family --

I can't speak directly to the SX-42, but most of the Lamb single
crystal filter circuits are similar. Here's the scoop on the
similar circuit in a SP-210:

(from TM 11-866)

14. CRYSTAL FILTER

a. The Quartz Crystal Filter (T1) couples the 1st detector
(V3) to the 1st IF amplifier (V5). Its selectivity can be varied in
definite steps by the CRYSTAL SELECTIVITY switch (SW7) controlled
from the front panel by knob and pointer E7. In addition,
its selectivity characteristics can be greatly sharpened on one side or
the other by adjusting the PHASING condenser (C32), which is
controlled by knob E8.

b. When the CRYSTAL SELECTIVITY switch is set at OFF the quartz
crystal is short-circuited and signal voltages present in the
secondary of the 1st detector plate coil (L26) are impressed
directly on the control grid of the 1st IF amplifier tube (V5).
At any other setting (1 to 5) the quartz crystal is in use and acts
as an extremely high "Q", high impedance, series tuned circuit
interposed between the secondary of plate coil (L26) and the 1st IF
grid circuit (L27, C33), which constitutes the load into which the
crystal works. Selectivity is varied by altering the impedance of
this parallel tuned circuit (L27, C33), which is accomplished by adding
resistance (R42, R43, R44, R45) in series with coil L27 and capacitor
C33. As this series resistance is increased (reducing the parallel
impedance of circuit L27, C33) the overall selectivity of the filter
is also increased.

Hope this helps,

>permeability of only 45 or so.

A ferrite rod has a large air gap in the magnetic path (the gap being the air path from one end of the rod to the other). This causes the "effective" permeability to be much less than the permeability of the rod. An approximate equivalent circuit can be constructed with resistors representing the magnetic reluctances of the paths. You have two "resistors" in series -- one representing the ferrite rod and one representing the gap. The gap resistor is typically much larger than the rod resistor. Amidon used to send out a chart showing effective vs. rod permeability as a function of rod permeability and geometry -- don't know if they still do.

If you were to wind the coil on a ferrite toroid, whose magnetic path is entirely in the ferrite, you would find the effective permeability to be essentially the same as the core's permeability. But of course it would make a lousy antenna. The whole idea of the antenna is to couple to the field going by in the air. The rod does this because part of its field is also in the air.

There is a nice plan for a pair of 807's in the 1947 Radio Handbook. I could send you a copy if you like. Are you sure you want to go to the trouble? Unless you already have a high voltage supply and high current chokes required it may cost you more to build than buying a nice QRP kit complete!

1111. Old base station Antenna?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-28 00:00:00 UTC
From: Steve Noonan <snoondhs@pop.k12.vt.us>
Message-ID: <32EE24D3.2AEA@pop.k12.vt.us>
Source record: 98038

Does anyone have an old base station antenna that they wouldn't mind giving a way to me? I am 16 and I am just gettig started. Right now I have a homemade antenna that I built from stuff around the house. It works ok, but I need to get a real antenna. The problem is, I'm broke. So if any one has an old base station antenna that they don't need anymore, I would appreciate it very much if you would consider giving it to be. I live in Danville Vermont. If you live within a couple of hours from here I could come pick it up. Or if you don't live close I could pay for shipping. I would really appreciate a base station antenna, also if anyone has an old power supply that they don't need, I could use one of those to. Right now I am running of a 12 Volt adapter that is meant for a cordless phone. Makeshift, but it's working for now. Thanks in advance!

> Steven Swift wrote:
>
> I have a little 'c' program that calculates what you need for loop
> antennas. .....

In a previous post, I mentioned that I couldn't balance measured results against predicted results (assuming published WWVB field strength gradients) on a ferrite core antenna at 60 kHz. That predicted value, though, ignored the permeability of the core.

As Steve's post mentioned (and which I didn't know), the voltage available (at a given field strength) from a loop antenna is multiplied by the effective permeability of the coil. While the measurements couldn't approximate the predicted results when ignoring the permeability, I also couldn't approximate the predicted results assuming a value of 850 (#33 ferrite core).

I measured the inductance of the ferrite rod loop antenna last night. I measure 9.98 mH (call it 10). The coil consists of 400 turns on a 1/2" diameter #33 ferrite core. The coil is single layer and about 4.5 inches in length. If I did the math properly, I get an effective permeability of only 45 or so.

Using this value, the predicted and actual values of available voltage are very close.

Unfortunatly, Farnell in the US and Newark seem to have merged, and if you call the number that was given for Farnell, you get Newark, and if you request a catalog, you get a Newark catalog. Not an altogether useless thing, but I'd like to see one of these really neat Farnell catalogs.

Farnell now distributes in the US. They have a terrific catalog. They are located in South Carolina. I don't have their catalog at home. Will get the info at work today and post it here if someone does not beat me to it.

Bob Doyle (doyle@primenet.com.DELETE-FOR-EMAIL) wrote:

: Ya but...

: I think you can always match the impedance that the device wants to
: "see" for optimum NF to 50 ohms and get a 1:1 VSWR.

?? Maybe I'm reading this diffrently than you meant...but if your
circuit's input impedance is 500 ohms and optimal noise figure occurs
for a 200 ohm source impedance, when you do the 4:1 match from 50 to
200 to get optimal noise figure, you have a 2.5:1 SWR.

But that's not to say you couldn't change the circuit (through [negative]
feedback) to modify the circuit's input impedance to get a match, if
that is important to you. In a television receiver, for example, you
wouldn't want to have a lot of echos on a long transmission line, because
that can lead to ghosts. On the other hand, there are cases where you
want to have a load that's a lot different than the source impedance,
while maintaining good noise figure, and if that doesn't occur naturally,
you can aid it, again through feedback.

I know it's bad form to follow-up on your own article, but here's an
approximately correct closed form solution.

Let L=length of rod
d=diameter of rod
Um=material permeability
Ue=effective permeability

The following formula are almost right:

set k = 0.022*exp(-0.039*L/d)

then Ue = Um/(1+k*(Um-1))

This will be close enough.

>Does anyone have any experience with the small version of the Johnson
>Match-Box for WARC Band coverage? If so, what was the modification and
>does it reduce the units efficiency.

The procedure that I used with my Matchbox Jr. was to select the nearest
ham band and adjust both knobs until a match is found. I done this
only with balanced, ladder line fed antennas that presented an impedance
below 1500-2000 ohms. The matchbox does not like high impedance feeds,
WARC band or not. I had no trouble matching various antennas on the WARC
bands with various wire antennas. It will NOT match 160 meters without
extensive mods that will ruin a nice Matchbox, IMHO.
I have run 700-800 watts through my little Matchbox Jr. with no problems.
The manufacturer specs it at 275 watts max.
I really like the Matchbox because its easier and faster to tune as well
as more efficient than a T-tuner. But it has its place and its not good
for end-fed halfwave antennas and other high-Z matches. Also, why use a
nice inherently balanced tuner like this on a coax line?

Stan, you and Rob and Jim are really showing yourselves to be buttholes. Like typical LIBERALS you resort to anyone with morals as a "nazi". I'm sure my friends in the JDL would appreciate that a lot. Did you also vote to re-elect that adulterous anus from Arkansas in the Oval Office? It wouldn't surprize me in the least, but that's all off topic, I suppose. If you knew anything at all about real nazis you'd know that it has something very much in common with your beloved liberalism: SOCIALISM... Rememeber? "Nazi" is short for "National Socialist",(in German "national" is spelled "nazional" or something like that).

You buttholes have a lot of nerve. You who like to run around using the term "nazi" on anyone you think is too strict are watering down people's knowledge of what evil scumbags the REAL nazis were. And then out of the other side of your face you vote, march and screem for:

1: more government

2: gun-control

3: godless schools to force lies into our kids heads such as there being nothing wrong with perversions like homosexuality

4: re-enslaving most of my people into dependancy on government

5: the continued legalization and taxparer-funding of that damnable holocaustic carnage upon infants,(aka "abortion"), which has murdered hundreds of millions of Americans, started by a true Nazi sympathizer and a true racist named Margeret Sanger who was the founder of the notorious group called "Planned Parenthood".

...and all the other such socialist crap you liberals defecated upon America and the world and yet with all that evil you liberals impose upon us you DARE to call any of us moral conservatives a "nazi"? That HAS to be the most BLATENT and arrogant example of hypocracy anyone has ever yet committed!

Yeah, this really IS way off this newsgroup's topic, but YOU were the ones who pushed my button by calling me a nazi when I am one of the most anti-nazi people I know. And as far as I'm concerned, anyone who is for the lowering moral standards, be it a moral standard that is related to the ham radio hobby or not, displays that they have no conscience, no decent upbringing and nothing to offer ham radio except degradation. And anyone who cheers them on is no better either.

> > I think your comments were great and to the point. Last thing we need on
> > this group are the thought police. Personally I always try to give an
> > answer if I have it. The responsibility lies in how the information is
> > used.

Yeah Stan, why dont we just get rid of all the rules and create a spectrum wide citizens band... is that what you want? That's how you make it sound. If you want to jam or help jam communications, do us hams who CARE about the hobby a favor by leaving your license at the door as you go out to buy a CB radio. Then you won't need to BUILD something to jam 27 MHz... you'll have a CB and you can play "drop the mall" all day long.

> > Gad! I sure am glad MArconi and Edison (or Tesla) didn't have to put up
> > with these types, we'd all still be senfing smoke signals to each other.

And you'd be figuring out ways to jam that too, I'll bet.

> I dunno! they would probably be in with the EPA whining about how the
> smoke singals are causing 'second-hand-smoke' fatatalities!

The EPA? Isn't that YOUR bunch? Anyone against good moral conduct HAS to be a liberal,(that's the whole point of this reply). To a conservative, good moral conduct comes FIRST, even above tax-cuts,(preferabley WITH tax-cuts)!

You guys got some nerve calling an Alan Keyes/Abe Lincoln/Teddy Roosevelt type of Conservative Republican a nazi. In my book licentious liberals are so lame they aren't even worthy to kiss the southbound end of a northbound rat. We have a repeater set aside for your type in Los Angeles on 147.435 where all the queers and weirdos can go screw up without being hassled while us hams who want to respect the rules use the rest of the spectrum and as long as the animals stay in their cage we don't shut them down. Usually they don't stay there and then we and the local OO's get to enjoy a good hunt.

As far as I'm concerned you who bash me for endorsing good morals in the hobby are just a bunch of Richard Burton wannabe's.

You have just seen that can't just push me and think I'll turn tail and run. I will not just push back... I'll blast back with both barrels.

You have a problem with me disliking conjecture and opinions when what I
was asking for was measurements? Unlike most of those 6-digit income
operators who can afford to buy everything off the shelf but now and then
dabble in a small project just for fun, I'm dirt-poor and build what I
build out of sheer neccessity, so can't afford to waste materials and
time on errors caused by bad information. I can't afford to not get it
right the first time. I HAVE TO take it so seriously, because any money

wasted on errors could have gone toward catching up on bills or on food.

> While YOU'VE been bitching about the rest of us what have YOU done to
> promote the hobby in positive manner?

If you weren't skipping posts you'd have seen some things. I'm not going to sit here and brag on myself. And as far as I'm concerned, having a fierce attitude,(which I admit I have), is not immoral, nor is there any rule against it. If you waste a commodity which is precious to me such as my time, you can expect to be told off. So don't act surprized when it happens. If you KNOW you don't have the right answer when the right answer is what someone needs, are you helping or hindering? Answer me that.

> I really love the part where you
> keep your anonymity, if your going to make a statement Teddy, right or
> wrong, sign your name to it. It doesn't mean much without it.

You just typed my name, so you must have seen it. You wouldn't have seen it unless I let it be seen. What do you want, a DNA sample? Tough!

Does the thought of turning them in make you squeemish or something?

Or like Mr Rodgers would put it... "Can you say FCC?"

> by getting just one of this type of CB'er OR HAM for that matter to ease
> off the key for just one day is worth this little prectical joke.

Don't you get it? Encouraging hams to violate the rules is no joke!

> The device I made had a range or perhaps 100 meters and effected no one
> but the person who was destroying all modes of receiption in a one mile
> radius.

But it did affect someone else. It cost you your integrity! And now that you are bragging about it here in public it's just one more case of outlaw conduct by a ham that someone can nit-pick about when they need excuses to give away OUR bandspace to UPS or some other service! THAT is the point. If we can be labled as irresponsible it can cost us dearly!

Do you even care about that, especially after we JUST went through the threat of losing 2M and 70cm to commercial LEOS? Probably not.

Those of you doing or endorsing this can just DROP the lame excuses. Like I indicated in an ealier post, it's nothing but a selfish disregard for the law which makes you no better than the CB'ers, because you're stooping to that same level that they operate on.

This post was manually optimized for use with voice synthesyzer. Some items may appear to be misspelled to the sighted, but they have just been spelled more phoneticly.

On Sunday, January twenty sixth 1997, Dana Yeomans wrote:

hi there, i aggree with you, i am blind, and have to listen to the voice synthesyzer, and i wish they wouldn't post pictures on web sights. the fellow that invented netscape should have his but kicked, because it don't do the blind any good. so take care all from n4pge in griffin, georgia.

My reply to Dana is as follows:

May I suggest that you switch to a text based browser such as lynx?

To use lynx, you would need an internet account called a unix shell because lynx is a unix program which you operate remotely using an ordinary emm ess doss based terminal program such as telix for windows which has the type of terminal emulations most compatable with lynx such as vee tee one oh two.

Since lynx is purely text based you should have much less trouble from any pictures you would have encountered on web sites using a frame based browser such as netscape.

Lynx is not very hard to learn. It has key press commands instead of the point and click icons so your voice synthesyzer will almost never find something that it can not read. The only graphic visual effect it has are the hyper text items which activate another you are ell if you highlight the hyper text by positioning your cursor over it with your down arrow or space bar and then hit your enter key. However, lynx can allow you to toggle it to display numbered choices instead, if the web page you are on allows it.

I just thought that I should mention lynx to you in case you had never heard of it or did not know what lynx was. If I have not presumed incorrectly, your voice synthesyzer program probably works better when it encounters text than graphics. If so, then maybe my suggestion can help your situation.

You can get a fair price on a unix shell account for twenty dollars per month with unlimited hours from a company called prime net.

prime net is correctly spelled as one word.

spelling is pea are eye emm ee enn ee tee

The toll free number is for prime net is 1, 800, 4 6 3, 8 3 8 6

I am not with prime net only because I got a better deal from a smaller company that only serves southern california.

Good luck Dana and seventy three.

Signed

Ted

The following is a short warning that I put in my posts.

Warning to spammers.

The email address in my From header is incorrect.
The correct address is teddyb@caprica.com

Spelling phoneticly:

tee ee dee dee why bee

at

see aee pea are eye see aee

It was changed to defeat systems that automaticly abuse email by sending unwanted advertizements.

My Email is neither a newsgroup or a public forum.

I do NOT want any advertizing via Email. Who ever sends unsolicited advertizing via Email risks prompt cancelation of their internet service without refund and possible prosecution for harrassment and/or fraud.

End of warning to email advertizers.

hi there, he sounds like a nut for sure, i have been a ham for years, and haven't seen some act like that. .73's from n4pge in griffin, georgia.

My reply to Dana is as follows:

And after all the trouble I went to for over an hour and a half to manually reformat that previous post especially so that your voice synthesyzer might handle it easier.

Having an unyealding respect for the rules that have made the amateur radio hobby so great does not make a person a nut.

However, when a person risks his license and the reputation of amateur radio to satisfy a selfish and greedy urge to take the law into his own hands to deal with bad eleven meter abusers, that is not what I call a very rational act.

Signed

Ted

You are right, but they don't care about anything but themselves. That's exactly why I jumped down their throats right off. Ham radio is supposed to be a community venture, a "team-effort". That means knowing how to be a "team-player".

I was just talking to a friend the other day suggesting that we need to get back into doing things like antenna-raising parties like in the old days... yet another wonderful thing that has darn near disappeared from the ham scene due to self-centeredness. It's sad.

> wrt@eskimo.co

It's hardly my product, Rick, since I am not the only person who sells low vhf-Q suppressor retrofit kits.

Shortly after the original article about lossier VHF suppressors was published in the October, 1988 issue of QST magazine, I was contacted by an attorney who happens to be W5NTQ. He told me that I could apply for a U. S. patent of low VHF-Q suppressors within one year of copyrighted publication, and he recommended that I do so. I declined, so the idea fell into public domain. Thus, no individual or company can ever patent it. For some of us, it's just a hobby, Rick.

Bill: I agree that there has been a substantive technical discussion. If Rick has been seeing a "never-ending stream of anecdotal lip-flap", he must be skipping over the technical parts. Sure, the blather about fake photos (of arced bandswitches), , fabricated (KC0HH) testimony , and claims such as "it's the entire staff at Eimac" sounds a bit like a take-off on the O. J. Simpson civil trial, but that sort of thing SHOULD be easy to skip over---except for those who are mezmerized by such. OTOH, a purely technical discussion might be as dry as last Saturday's toast.

Rick: who made: " the promised in-depth technical discussion"?

RE: lack of technical topics: I have repeatedly tried to engage one of the naysayers in this debate in a technical discussion of Wes Stewart's

scientific measurements of Rp in various types of VHF parasitic-oscillation suppressors, but so far I have been stonewalled, Rick.
Rp should be the core-issue here since VHF voltage amplification is basicly Mu*VHF-Rp. More VHF Rp equals more VHF gain in an HF amplifier. Less VHF-Rp equals less VHF gain in an HF amplifier..

>
>

Hi Harry,

Actually a bandswitch can fail from many causes.

Improper tuning, a fault in the load, improper lead dress around the switch, dirt or deposits (one common cause is if the rotor rubs the ceramic, it deposits metalic trails along the ceramic) and so on.

One person even has a fettish about parasitics, he even $ells kits to "cure" parasitics even though there is no evidence they ever occur. He admits his own PA arced from a load fault, and ignores other people who have said the same thing.

Good science tells us if the switch arcs, it is from RF near the operating frequency. The tank capacitor has almost zero reactance over the upper VHF range, it looks just about like a short circuit.

source ---------------{{{{-------{{{{{{{{{{-------->
I ^ ^
tune cap === ^---switch--^
I
ground

It is impossible to develop enough voltage across the few ohms of tune cap reactance shunting the source to ground to allow the switch, downstream through even more low pass components, to arc.

The cause of switch arcing HAS to be excessive voltage near the fundamental operating frequency, or one of the other causes listed above.

I think that you'll see this makes sense, unless you believe in pathological science.

>Wow, neat information. Is there a gogd book that explains all of this
>stuff and more about ferrite/loop antennas?

I'm not sure. When I had the need some years ago to design a switching power supply, I discovered that my EE education had included almost nothing about the principles of magnetics, so I had to dig it out from several textbooks.

The only thing I can recall having read about ferrite "loopstick" antennas is a short article in the National Semiconductor Audio/Radio Handbook. My copy is dated 1980. They reference a Bendix application note by HJ Laurent and CAB Carvalho titled "Ferrite Antennas for AM Broadcast Receivers".

Hopefully someone else can come up with a more readily-available reference.

1137. Re: SSB filter / IF amp using opamps

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-29 00:00:00 UTC
From: mcovingt@ai.uga.edu
Message-ID: <5cnja4$i0k@hobbes.cc.uga.edu>
Source record: 97939
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

A few points...

(1) I think the reason op-amps aren't normally used is the noise level. In radio receiver circuitry, all the amplifiers need to be low-noise. But present-day op-amps may be good enough; earlier ones weren't.

(2) A Q-multiplier is an oscillator that doesn't have quite enough feedback to oscillate. Thus, it's an amplifier with a strong peak at a particular frequency. Q-multipliers are an older technology. Good IF filters are nowadays made with crystal filters.

(3) One of the most important attributes of an IF filter is its "ultimate attenuation," i.e., how much attenuation you get when you are well away from the passband. The more the better, because an unwanted signal could be as much as 50 dB stronger than the one you're trying to hear.

I have a theory document under the ASP 4.0 Freeware page
describing the input NF impedance does not mean a "match".
The Preamp only needs a 50 Ohm resistive source. The
antenna doesn't care if it see's a mismatch in this case.

Roy Lewallen wrote:
> This is direct measurement and calculation of ISWR, which is numerically
> the same as VSWR, commonly referred to as SWR.

Hi Roy, here's a relatively easy way to indirectly measure the
SWR on the ladder-line without measuring the Imax and Imin.

First measure the actual voltage conversion ratio of your balun,
e.g. I put a 200 ohm dummy load on the output of my 4:1 balun
and adjust it for a 1:1 SWR on the 50 ohm side.

Then I locate the PC-200 point on the ladder-line. (I'm trying to
coin that term for the point on the ladder-line where placing a
single Parallel Capacitor will result in a purely resistive 200
ohms. The SL-50 point would be where a Series L(inductance) will
cause a purely resistive 50 ohms). The location of the PC-200 point
can be closely estimated using the transmission line feature of EZNEC.

So I have a known capacitance at the PC-200 point resulting in a
1:1 SWR on the 50 ohm side of my 4:1 balun. Eureka, the parallel
inductive feedpoint reactance is equal to that capacitive reactance.
Put that inductive reactance in parallel with 200 ohms, convert it
to a series impedance, and that series impedance is the FEEDPOINT
IMPEDANCE OF THE LADDER-LINE AT THE TRANSMITTER. Knowing that series
impedance and the Z0 of the ladder-line allows us to calculate the SWR.
Knowing the length of the ladder-line and the velocity factor allows us
to calculate the antenna feedpoint impedance and the impedance anywhere
up and down the transmission line. Of course, the feedpoint impedance
at the transmitter is probably the most useful information.

Source record: 97946

I'm building a PA stage for 160 but I'm a little confused about RFC's.
It must have a low DC resistance as it's being used in a VMOS FET O/P
Stage at about 40 watts.
I would like to use a piece of ferrite rod from an old MW radio or even
a T50 torroid. Unfortunatly I have no idea how many turns to put on it

I have heaps of 26 SWG wire (U.K) so I'd like to use that if possible.

I don't want to spend ages trying to work out complicated math (even if
I could do it) so if anyone could help me I would be very greatful.

Regards and thanks in advance.

I would like to build a small transmitter to xmit a (burst) code generated by an IC (eg. Microchip's Keyloq chips) with a range of 500-1000metres. To keep it small, I want to use an IC for the transmitter as well as the RF amp (if needed).

Do such chips exist? Are they easy to use? What are the implications of using a transmitter with this range?

Can anyone with info please reply to my email address.

Thanx

>The article shows how to build a switching power supply
>that will deliver 2000 VDC at 1 amp or so.
>
>Thanks, Brett

The article is Feb. or Mar '91. There were some typos in
the schematic, and so several corrgenda were printed in
following QEX's, including some discussion about the output
filter and about the gate-driving parts. I personally
started the circuit, but found the "50-50" duty cycle
square wave generator was anything but. So I went for
a flip-flop, using the Q and Qbar outputs as 50% duty
cycle, opposite phase inputs. At this point, it's not
wired up with the big transformer, sucking the big amps
out of the wall yet; it's a little power supply at the
moment, so I can't comment on the full-power capability
of the circuit as reported.

If you ask me to, I can locate the exact issues of the
article and the comments (that I know about). Send me a buck
or two and your address, and I'll send you copies of all
the articles and comments I have (if the ARRL doesn't
complain about copyrights, etc).

Thanks to the persons who answered my post for the rotor controller.
I downloaded the info from Amsat's website. I would like to have copies
of the schematics of the FODTRACK20 rotor controller interfaces. I
couldn't figure out how to extract them from FODTRACK20.DOC.
I am looking to build them to replace my analog controls. Thanks.

The RSGB microwave books (volume 3?) have a TWT amp design, complete with
board layouts. The voltage stabilization is done with a feedback method
of some sort -- I don't recall if it works like you suggest.

Wrong, less and BTW less NAZI-like intrusion into individual's lives.
> 2: gun-control
Couldn't be farther from the truth.
> 3: godless schools to force lies into our kids heads such as there >being nothing wrong
with perversions like homosexuality
Your ethics are as corrupt as your politics. You apparently (point 3)
think schools *should* teach sex, morals, ethics... should they
also require all males be circumcised to enter school? Do you
have any other religious requirements?

I think the schools have no right to teach any of those until we see
some
success with math, reading, the spoken and written language.

> 4: re-enslaving most of my people into dependancy on government

What the *hell* are you talking about? You are the one wanting to run
other people's minds and probably later their bodys(actions).
Will you allow independant thought or go straight for the throat like
the thought police in 1984 by Orwell. 're-enslaving most of my people'
my tired ass. I don't care if a person is Jewish (apparently it's
important to you) or anything else, if they stay out of my business,
I'll leave them alone, but the self appointed enforcers of morals,
ethics
etc, are NAZI's regardless of their various pursuasions religious,
moral,
race, or creed.

> 5: the continued legalization and taxparer-funding of that damnable
> holocaustic carnage upon infants,(aka "abortion"), which has murdered

You sure have a problem keeping to topic... let me remind you...
Someone's request for information and your hypocritical refusal to
answer and also castigate them. Where *did* you get that badge?

> hundreds of millions of Americans, started by a true Nazi sympathizer d
> a true racist named Margeret Sanger who was the founder of the notorious group called
"Planned Parenthood".
There's that worrying about other's morals and minding other people's
business... stay the hell out, social worker.
<snip>

Respect whatever you like, but you still have no license to enforce
anybodies urles or ethics. The usual method is to go to the group
that *does* enforce the rules, and get a badge from them. Until then
if you don't have a badge you don't enforce the ethics or rules.

> As far as I'm concerned you who bash me for endorsing good morals in the
> hobby are just a bunch of Richard Burton wannabe's.

Who gave you that badge as the Lone Ranger of Morals?
I think your real problem here is either constipation or a secret desire
to be a social worker.

> You have just seen that can't just push me and think I'll turn tail and
> run. I will not just push back... I'll blast back with both barrels.

blastless & brainless.

From: Rick Cruickshank <rick@keepntouch.com>
Message-ID: <32EF938B.3CDF@keepntouch.com>
Source record: 97956

Kenwood TS-530-s HF rig (SSB only)
includes external VFO-240 (plugs directly into 530-s)
USB/LSB/CW modes
operates: 10-160 M. (including 12,17,30 M. WARC bands)
digital readout
sollid state recieve/tube transmit - (2) 6146 finals (1) 12BY7 driver
100 watts output
includes: Astatic D-104 (hand held power mike)
boxes and owner's manuals with both units
$600.00 as package (negotiable)

This would make a nice starter rig for someone just getting into HF, or
a nice "stand-by" second rig.

Just on a goof, WA2IYH and myself wired his SB200 linear amp to work in
both directions! It boosted the receive signal about 10db (same as in
transmit?!) and NO ONE could overload that preamp! Not bad for a pair
of 160w tubes! We thought the directly heated cathodes would cause hum,
but this is RF remember.....

Absolutely wrong. I have bought many parts from them, as well as getting
regular updates to the catalogs.

I simply call their main #, (718) 934-4500, tell them what I want and
give them my Visa #. The parts are in my hands within a couple of days.

I see in their latest VCO designers handbook they have a number for
"Small Order accounts, Dept F" (800) 214-6428 x 606

There was a company in Canada that made crystal filters. I have a
9MHz SSB filter made by them. I got around 1975, and it came from
somebody who got it from somebody else. Meaning, I am not quite sure
exactly when it was manufactured. I do recall that there was an
article in Ham Radio magazine around 1973 or 74 by a VE3 that used
the same filter.

The bad news is that while I can very easily locate that filter, the
plate that described it came off. It's around here somewhere, but
it would take a lot of effort to find it, so I can't easily tell you
whether the filter you have would by some lucky chance be the same.

Either I can't remember any details, or I never knew anything about
Snelgrove, other than that they made this filter that I have.

Not very useful information.

Hi All,

I just decided to try my hand at the 1750M band by purchasing a
Curry Communications EXP-17 unit. Anyone work this band in the
Midwest (Missouri) or anywhere for that matter.

Anyone have experience with this unit?

Message-ID: <32F0AC32.5534@fuwutai.lucent.com>
Source record: 97844

Thanks for the replys.
Most of the problem seems to be that all my xtls are very old and the 40 meter xtl I was using is chirpy. I tried a tv color burst xtl on 80 and it didn't have the chirp.
I checked through the power supply and the plate/screen voltages don't sag more than the manual indicates when key down. (although the bias voltages do sag, and the bias resistors don't seem to have drifted totally off the map)
When listening on anothr receiver in the room, the note sounds rough so either my regulation does need work or at this close proximity I'm hearing the neon oscillators.

GO GET 'EM TED!
The only RC's you'll find on 27 Mhz are TOYS. The real "$1000"
RC's are on VHF and UHF, usually around 70 Mhz or 470 Mhz. Yes,
there are hams that use 6 meters and 70cm for RC. As far as
the issue of jamming goes, it is ILLEGAL -- PERIOD. Whether
you agree with the issue at hand, jamming is malicious interference
and is ILLEGAL no matter what the service.
[off subject=ON]
[SoapBox = ON]
I heard an interview with the chief editor of the New York Times
last week that concerned the recording of telephone (cell phone)
conversations of "Mr. Newt". He stated that it really
didn't matter that the evidence was gathered in an illegal
manor but only the seriousness of the charges involved.
SCARY!!!! Does this mean that if you are charged with
a serious crime that your constitutional rights just go
out the window? The nature of the evidence or the manor
in which it was obtained doesn't matter? REALLY SCARY!!!
There are many guilty-even-if-proven-innocent crimes.
Sexual harassment, child abuse, rape -- all very serious
but they are thrown around so flagrantly in many instances
that they are deluded and many times the REAL crimes are
lost in the shuffle. Kind of like crying wolf.
And these jokers (Stan and the like) accuse us
of being Nazis? My grandfather was there! I have
hundreds of pages of his memoirs of that era. It was
truly scary what the Nazis did to people they didn't

like. Even their own citizens. It is starting all over in this country just like it did in Germany in the late 1920's and early 1930's. REALLY SCARY!!! [SoapBox=OFF]

Sorry for getting of the subject of this newsgroup but these liberal idiots that throw around politically-correct insults like Nazi, homophobe and the like just burn me up. They run out of arguments of their own (assuming that they had one to begin with) so they use these politically-correct insults to blur the subject at hand.

Kevin, WB5RUE
Those who are willing to give up liberties for safety's sake deserve neither liberty nor safety.

etc.

This reminds me: with some of the new wide bandwidth opamps that work into
the RF region, I'd wondered about making active filters in a typical IF
region of 9 MHz or so. Limiting factors might be dynamic range, compared
with an analog filter.

>about them.

I got cores "200-3E2A" from Johnson Shop Products, at $4.00 each.
According to the ARRL, type J material = type 3E2A material, (and 193 ~
200). This makes $40 + shipping for the cores.

Of course, if you absolutely MUST send Amidon all your money, I'm sure
they'll be more than happy to take it.

I did pay full price for the FETs, $17 each for five of them, to IXYS
directly.

>
>While the small size is appealing, I also would question the reliability. One
>screw-up and an awful lot of hardware goes bang. Just my humble opinion.

... which is why I haven't had the balls to make the full power version yet.

By the way, the article claims the whole supply is <8 lbs, but between the
cores and the input filter caps (they spec 5500 uF @~400 V) that's more
than that right there. Does anyone know where this filter cap is in the
photo of the circuit? It should be big enough to see, but I can't find it.

: Hi and thanks for reading.
: I have a quesion for any designers out there.
: Can a mini-circuit VCO (or any low cost VCO) be used in place of a
: crystal in HAM Radio Transceivers?

Well, not just a plug-in replacement perhaps... and if you want
frequency stability, you are going to have to lock it to something.
They are not intended to be used like a stable VFO, but as part of
a feedback loop that locks to a solid reference frequency, usually
generated with a ... crystal oscillator.

> In the beginning there was nothing, therefor I'm satisfied now

Hi Bart OM,

Since the 807 was one of the most popular tubes for ham rigs,
there must be hundreds of designs that used them. Look in any ham
radio magazines or handbooks from WWII through the 60's. I have
built rigs using 807's, 807W's (smaller version of 807), as well as
their near-equivalent, the 1625. Very friendly tubes to use.
Have fun!

Apparently, it happens, Harry. In the letter from an ARRL Director (which is published on my Web site) he describes such an event.
Quoting
"We both lost perfectly good 8877s due to internal flashover within the tube itself most probably caused by an improper load (wrong antenna) being switched to the amplifier. In my case I had a guest operator who inadvertently switched in a 15M Yagi while operating on 20M. There was a loud "bang", and the 8877 along with the bias circuitry, RF plate choke, and both meters were destroyed. I didn't need a network analyzer as is suggested by Telewski to understand the problem! The wrong antenna presented the tube with an unrealistic plate impedance prompting the parasitic VHF or UHF oscillation. KD9Q's amplifier, which was commercially built, experienced a similar situation."
(Note: the 'internal flashover' he mentioned seems to be commonly caused by loose gold inside the 8877) In the recent shipment of three, kaput, 8877s I received from Lon, K5JV, two of the 8877s had loose particles of gold, which created abnormally high internal leakage. When gold lands on the ceramic insulator between the anode and the grounded grid, IMO, internal flashover is not impossible. In 1986, Eimac's now-retired Chief Specs Engineer, W. B. Foote, told me that the 8877 design engineers determined that gold evaporates from the 8877's grid during an oscillation condition. I asked Foote what the frequency of oscillation was? He said possibly VHF, possibly UHF.
>
> Hi Harry,
>
> Actually a bandswitch can fail from many causes.
>
> Improper tuning, ...

When someone on this thread measured the maximum peak tune-capacitor voltage during mistuning in a SB-220, the result was 3700v-p. I tried

mistuning my SB-220 and nothing I could do would arc the tune capacitor or arc the bandswitch. No surprise there since the measured breakdown voltage of the switch exceeds 5500v. I mistuned my TL-922, and nothing appeared to arc.

...a fault in the load,

True. However, there was apprently no load-fault in Rick (KC0HH) May's case. (see Figure 15)

> improper lead dress around the
> switch,

Bzzzzzzzzzzt.......cough, cough There are no leads around the bandswitch in a SB-220, TL-922, or any other amplifier I have seen the insides of.

>...dirt or deposits (one common cause is if the rotor rubs the
> ceramic, it deposits metalic trails along the ceramic) and so on.

Tom: I have never seen an amplifier that uses a bandswitch whose rotor rubs on the ceramic. Which amplifier uses a bandswitch with a rotor that rubs on the ceramic?

> One person even has a fettish about parasitics, he even $ells kits to
> "cure" parasitics even though there is no evidence they ever occur.
...snip...
Sounds a bit kinky.
Evidence:
1. "Parasitics Revisited", 9/90 & 10/90 QST magazine.
2. Figure 15 and Figure 16(new, courtesy of W6IEG) at
<http://www.vcnet.com/measures/

> It is impossible to develop enough voltage across the few ohms of tune cap
> reactance shunting the source to ground to allow the switch, downstream
> through even more low pass components, to arc.

Tom are you saying that tune capacitors do not have internal VHF resonances? As I recall, someone measured the internal VHF resonances in a tune capacitor and posted the results on this thread. Does anyone remember who made these measurements?

> The cause of switch arcing HAS to be excessive voltage near the
> fundamental operating frequency, ...snip...

Does it make sense that fundamental (HF) energy could wipe out the VHF suppressor resistor, Rs, at the instant when HF-energy wipes out the bandswitch?
Factory-stock SB-220s have a penchant for tank arcing and wiping out Rs when operated on 40m. The SB-220's suppressor-inductor, Ls, has about 3.5 ohms of reactance at 7MHz. In my opinion, it would take around 20v to wipe out Heath's Rs. Since Rs and Ls are in parallel, in order to do this, around 6a rms at 7MHz would have to pass through Ls. However, Ls is in series with the 5pf of internal anode-C in the 3-500Z. At 7Mz, 5pF has 4500 ohms or reactance. From E=I*R, 6a*4500 ohms =s 27,000v-rms. Does

27,000v make sense? ..... Another problem with the HF-energy theory is that the 10m contact is usually the most damaged, while the 15m contact is usually damaged less, and the 20m contact even less so. This pattern of damage is not consistent with HF energy. However, it is consistent with what I would expect from VHF energy. In the photos of arced bandswitches on my Web site, such is apparent.

> I think that you'll see this makes sense, unless you believe in
> pathological science.
>
> 73 Tom

BTW, last week on KTLA-TV, which is Channel 5 in LA, newsman Hal Fishman reported that a TV-satellite which relays CNN and two other TV networks was permanently knocked out by a front-ejection solar disturbance, and that a number of military satellites were damaged at the same time.. Fishman mentioned a previous front-ejection solar disturbance which forced a Space Shuttle mission to return home prematurely a few years ago. ...Cosmic photons? Any comments, Mr. Rauch?

The rig has no voltage regulation. However, mine works well with crystal
control on 80 and 40 with a slight chirp on 15. I suggest you check the HV
filter caps for value and quality. You may be running some raw ac hum as well
as poor ps regulation.

OK Bart - let's see if we can help you then!

I have a LOT of schematics and articles available by the WWW for you,
including a FOUR TUBE 807s linear amplifier design etc!

You can get these easily via the web site at:

http://www.mnsinc.com/bry/hamfiles.htm

Look at the bottom of the page for details. You can then print out these
articles or save them on your hard disk drive as .TXT and .GIF or .JPG
files.

Let me know if you need any further help.

My understanding is that 'electronic grade RTV' is not acid based
('Neutral Cure'), and thus doesn't corrode the conductors. However,
the neutral cure stuff takes a *lot* longer to set properly. Horses
for courses I suppose.

Shel,
I don't remember about the -16, but my old HW-101 would chirp if the
OA-2 regulator tube was dying. Does the HW-16 have something like
that? I used one for a while, but I was 16 and an appliance operator
back then!

Ted, you are so damned warped I can't even understand why any of us even reply to your racist hatred.
It is people like you who give Amateur Radio a bad name. Face it. WE ARE ALL DIFFERENT.
If you don't like it, tough luck.

No try and lighten up a little and try and accept that while some may agree with your rigidly conservative ways, Most of us won't. Your beliefs are not mine.

Signed,

Jim.. The butthole libral who voted for the adulterous anus from Arkansas. And YES my vote was the one that made the difference. I Voted for him just to piss YOU off.

And remember, one mans sin is another mans right.

P.S. Go get a drink of water.

Hi,

In the November '90 edition of 73 Amateur Radio Today magazine, a 40 meter transceiver using a 74LS00 and a 74LS03 is described. The '00 is used as the oscillator feeding the '03 as a buffer with each of its 4 outputs connected together. I hope people can help me with a couple of questions:

1. The key is connected between +5V and the outputs of the '03 buffer stage via an 8uH inductor. I don't understand this! I would have thought this would increase the power consumption.

2. The receiver section has the simplest mixer I've ever seen consisting of 2 diodes back to back. I would be very interested to hear any comments from anyone on the performance of such a receiver.

Many thanks, Ian

Hi folks!
I have made a LOT of improvements at my web site.

Probably one of the largest lists of hyper links to great ham radio sites -
classified and grouped according to the following topics:

QRP
DX
CONTESTS
VHF
BOATANCHORS
BUY & SELL
HOMEBREWING
NETS
ARRL & FCC
QSL INFO
TUBES
GLOWBUG CONSTRUCTION PROJECTS
MODIFICATIONS
HAM CHAT LOCATIONS
RADIO HISTORY
PARTS
... and many more!

You name it - you can find it at my web site! Best of all it is FREE with no
strings attached, no annoying e-mails afterward etc.

Take a look and tell your friends:

Hi - I have another mystery transformer here if anyone can help to identify it:
This one has no brand name, and looks like the typical small 1" X 1" X 1.25" thing, upright mount with cover shields on it. All shiny metal covered with some kind of light yellow goop sealant.
Markings are:
MSY-P-43755
SA-7846

It has two 18 ga. red wires out one side.
The other side has three smaller gauge wires 22? black, white & blue.

ANY IDEAS?

Hi guys.
I have an interesting looking transformer here and wondered if ANYONE knows what it is or can help me find out?

It is marked TRANS INC. TM 4075

It looks to be about a 50 watt class of transformer, but I have no idea if it is a power transformer or an audio transformer or what!

It has about 8 lugs on each side, and they are numbered 1-16

Any ideas? Please e-mail me

I purchased a 733 at the 94 (I think) Dayton hamfest when just introduced. My radio went thru several trips back to kenwood. However I believe my radio was an exception. I like the 733 very much. It has many nice features. You can find new 733's for around $400. I paid about $600 (the money was burning a hole in my pocket!!).

The radio sounds good on the air..according to reports. It has no PL decode..that will cost you $60 or so..you'll need this in a big city. It does now have a backlit mike which is an asset. You can get it with a built in diplexor..mine has 2 antenna connectors which I prefer. The radio in my opinion is very lacking in heatsinking mass. There is a fan in the back but I'm not sure it helps much.

A note I put together some time back follows:

The 733 has this really nice feature of having 6 program setups. This means that you push "PGM" and then one of the 6 menu buttons and the radio sets all frequencies, offsets, tones, power level, backlighting... everything. You set up your favorite operating scenarios and save them to a program mode button. Its real nice.

If you will ever cross band repeat your radio, you can set up one or two of your program buttons to store the setup. You can cross band the radio in 4 button operations. Unless you like to spend 5 minutes pushing buttons each time you want to use the cross band features, this is the way to go.

If you store your cross band setup to a progam mode button, WHILE the radio is actively cross banding...BEWARE that any time in the future when you access that programmed setup...that the radio will immediately begin transmitting if a UHF signal is present. This is not a good thing. It would be easy to hit the wrong sequence of buttons and have a totally un-supervised repeater on the air for hours.

I strongly suggest setting program mode buttons while not in the cross band mode and only engaging the repeater function manually and purposely.

I'd like to know this too. I was thinking about building one to power my 2M 8877 until I started pricing components. The cores alone were going to be over $100 and FETs with those ratings aren't too common, so I shutter to think about them.

While the small size is appealing, I also would question the reliability. One screw-up and an awful lot of hardware goes bang. Just my humble opinion.

>popular some years back but can't find out much about them. There was a
>little mention of them in one of Don Lancaster's columns.

Eric, the late Sam Harris invented the parametric amplifier back in
the early 1960s. He published a theory and construction article in
73 Magazine. At the risk of misrepresenting it, the parametric amp
worked something like a MASER. It used a klystron to pump a solid
state diode circuit to create a population inversion. A VHF signal
coupled into the diode circuit was then amplified by stimulating
emission, IE triggering the population inversion to cascade back
to the ground state in step with the input VHF signal.

For its time, it offered a very good noise figure and very high
gain. Its chief competition was the WE416B tube preamp. Today we
can get better performance for less cost using a GASFET preamp in
a more conventional circuit.

I've probably got the original 73 Magazine article stored away in
a box around here somewhere. Finding it would be a major expedition.
One of these days, maybe after I retire, I'll get around to sorting
and cataloging all the old junk that I've squirreled away over the
years. Meanwhile, you'll probably have better luck doing a library
search.

The 74LS03 is an open collector gate (used as a simple inverter in this
circuit by tieing the inputs together). The inductor is the output tank
inductor, and the keying is in the power supply line. Keying the PA voltage
was uncommon in tube amps because of the hazard of the HV, but in this
solid state unit it is the only practical way, IE there's no way to key
the 74LS03 "cathode".

This is a NAND gate, and you could key one of the input leads on each
section, but the keying logic would be reversed, IE an open key would
send, and a closed key would stop sending. So you'd need another section
to invert the keying sense. Keying the OC voltage is the simplest solution.

>2. The receiver section has the simplest mixer I've ever seen consisting
>of 2 diodes back to back. I would be very interested to hear any
>comments from anyone on the performance of such a receiver.

I don't recall that circuit. Is this a "reciprocating mixer"? In that
design, the LO is at half the signal frequency and the dual diodes use
both halves of the cycle to effectively double the frequency when mixing.
This is pretty clever in that it eliminates the LO as a source of
"backwave" from the receiver. (Since the LO of a DC receiver is on
frequency, backwave radiation from the receiver can be a problem.)
Stability of a lower frequency oscillator is also better.

Date: 1997-01-31 00:00:00 UTC
From: jrybak@MesaState.EDU
Message-ID: <5ctadt$dpb@mesa7.mesa.colorado.edu>
Source record: 97748

Can anyone tell me when the 0 call area was created? I am trying to track down who, if anyone, previously held my call. I've had it for almost 31 years but I probably wasn't the first holder of it.

Thanks for any help you can provide.

73,

Jim Rybak W0KSD

Group,

I have access to some recently replaced UPS units.
These units have 6 and 12v "gel-cell" batteries that
I would like to put to good use (ARES, APRS, etc...)

Is there a recommended and/or quick'n easy method
for testing voltage, amps, and longevity?

There is a similar design available via my web-site at:

http://www.mnsinc.com/bry/

in the HAM RADIO RESOURCES section under ham files.

Ian Mitchell <ian.mitchell@research.utas.edu.au> whistled a happy tune like:

|>Hi,

|>In the November '90 edition of 73 Amateur Radio Today magazine, a 40
|>meter transceiver using a 74LS00 and a 74LS03 is described. The '00 is
|>used as the oscillator feeding the '03 as a buffer with each of its 4
|>outputs connected together. I hope people can help me with a couple of
|>questions:

|>1. The key is connected between +5V and the outputs of the '03 buffer
|>stage via an 8uH inductor. I don't understand this! I would have thought
|>this would increase the power consumption.

|>2. The receiver section has the simplest mixer I've ever seen consisting
|>of 2 diodes back to back. I would be very interested to hear any
|>comments from anyone on the performance of such a receiver.

|>Many thanks, Ian

1243. Conversion gain

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-01-31 00:00:00 UTC
From: tim_hynde <tim_hynde@idecc.com>
Message-ID: <32F293FE.5C5D@idecc.com>
Source record: 97755

Im confused, (this is no surprize to my wife or children) When your

injecting a 7.040MHz signal in to an NE602 mixer in a 40m DC reciever

what are you mixing? Isn't the VFO really being used more like a BFO? I

think I understand that part but:

What if I take the same circuit and use a 3MHz VFO and then put a 4MHz

crystal on the output of the NE602? Have I created a superhet? In

addition, now that I've mixed the signal do I get conversion gain from

the NE602?

My big question is:
Do you get the same gain when using it in DC operation?

I hope these questions are not too far out in left field.

Hello all...

This is an updated list as of 1/31/96 additions and price changes.

We recently purchased ANOTHER BATCH of DRAKE PA TUBES. So We're extenting the SPECIAL ON...
6JB6 NOS RCA, SYLVANIA, GE, etc. (normally these run $22. ea) Our price while present stock lasts $ 18.ea.

We also have:
4-125A/4D21 have 3 RCA, 1 Amperex NOS $75.ea

2A3 RCA others USED BUT GOOD $25.ea

2A3s I have 10 new RCAs $70.ea
Willing to do some trading on these

6146(A), (W) NOS US (sylv and others) $16. ea

6146B GE NOS $24.ea

4CX300 EIMAC NOS $115.ea

EL-34 SVETLANA matched pairs $30.pr

807 RCA and others NOS $13.ea

811A SVETLANA w/fact warr. $19.ea

572B PENTA (American materials) $54.ea

3-500Z PENTA 13 month warr $118.ea

3-500Z PRIDE 12 month warr $95.ea

4-400A PENTA 13 month warr $170.ea

4-400 US lo hrs certified full output $60.ea

833A Svetlana new w/fact warr $130.ea.

6JS6/6LQ6 US we just got a few in $25.ea

We have no 8950s but we have a few other common sweep tubes.

5868/AX9902 only few hrs use. certified to be full output 1 pair only.

Can you use these? Make us a fair offer, or trade.

WE HAVE MANY OTHER TUBES SO IF YOU DONT SEE WHAT YOU NEED HERE PLEASE CALL.

We take VISA/MC

>always.

In many ways this question is the equivalent of how many angels can dance on the head of a pin. My original answer and I can't find a better one, is however many God wants to.

If you want real fun though, try loading mouse.com or mouse.sys in the boot to dos session and then type win. What happens then? Win95 is an operating system, or at least does all of the things that an operating system does. I might also point out that if any operating system allows something to write in the wrong place it goes flatline too. I've made Unix, os/2, win NT, Desqview, dos, cpm and a lot of other alleged and real operating systems go flatline too. There are people who hate Win95, and others who love it. Those who love it, cheer when it's pointed out that most new computers come with win95 as the OS, while those who hate, claim it's the result of good marketing and collusion. I personally thought that WFWG met most of the definition of an operating system with a dos boot loader, but that's an entirely different problem. My basic point though is that it's meaningless to discuss what's an operating system unless there's a common definition of what one does, and what one doesn't. OS/2 for example won't usually die if a dos program tries to write to the wrong area (Note I said usually, I managed to mess up more than once with dos programs), but it also has problems letting some dos programs function properly without severe tinkering. -art clemons-

>assume that it is a notch type of duplexer. Does anybody have any
>experience making one of these? And also how stable was it?

George, a notch duplexer essentially uses coaxial line stubs to create the notches. The "coax" used is typically large diameter rigid sections which we call cavities. The only real difference in the cavities used and ordinary rigid coax is the mechanical arrangement allowing you to vary the length of the stub by turning an adjusting screw. If you have the patience to "cut and try" you can tune ordinary line sections too.

Now if you try to use small diameter flexible coaxial cable as the stubs, the Q won't be high enough to give you really deep and narrow notches, and mechanical stability won't be very good either. So you really want to use rigid airline for your stubs.

If you have access to some scrap broadcast rigid airline, then you can easily make a good notch duplexer from it. Either 3 1/8 inch line or 6 1/8 inch line will do nicely. The larger varieties of Heliax may also have high enough Q, though it presents some mechanical problems. But ordinary flexible coax like RG-8 just won't do unless you can live with a very wide split and don't need much isolation.

Now you can *make* rigid airline. Copper pipe is best, both because of its high intrinsic conductivity and because it is easy to solder, but you can use aluminum pipe. Brass, and especially iron, are poor materials to use as your "cans" because of their lower conductivity. And in the case of iron, because it is ferromagnetic, which reduces skin depth dramatically, it is highly resistive to RF. Of course increased resistance translates directly to lower Q, and that means shallower and broader notches.

There is another type of duplexer made from coax. This is the so-called "rat race" design. It doesn't use any stubs. It uses a ring of coax with Tees at appropriate points to take advantage of phase cancellation around the ring as the means of isolating the Tx and Rx. This is a 4-port network with the ports being Tx, Ant, Rx, and a 50 ohm load. The lengths between the various ports are arranged so that there is phase reinforcement between Tx and Ant, and between Ant and Rx, but phase cancellation between Tx and Rx, and between Ant and load. This works well at microwave, where waveguide is used instead of coax, and it works Ok at UHF with large rigid airline coax, but trying to use it at 2m with flexible coax just won't give you enough isolation.

Gary

Henry - yes it should be possible. The main limitation would be the extreme deafness of the receiver. You are right in that a crystal set for VHF is just the same as one for MF, but with a smaller tuned circuit (4-6 turns around a pencil and a 2-20pF trimmer should be about right for the air band - but remove the pencil after you've wound the coil).

It is possible to increase the sensitivity of a crystal set by applying bias to the diode. Also some audio amplification (say using a 741 chip) will be useful.

I suggest you get in touch with the WA VHF Group, particularly the people who run the foxhunts in Perth. They use devices called 'snoop loops' that are just what you want (a crystal set with bias on the diode, followed by a 741 audio amp). I built one and they work fine. You can detect an AM fox transmitter over a range of several tens of metres (maybe more). They had an information sheet that had a circuit and construction details (I have a copy here). Building that unit and readjusting its front end for airband should be quite easy.

The DC receivers I've built haven't been much good for AM reception. For a start they need to be extremely stable (much better than needed for CW/SSB) and it might also help if there was an audio high pass filter (200Hz?) in the audio stage. It should be possible to get a DC Rx going for casual reception of AM, though I've never really seriously tried.

Superhets are a different proposition. To convert it to AM you would need to:-

1. Switch off the BFO injection to the product detector
2. Install another form of detector (eg a single OA95 germanium diode)
3. Broaden the IF selectivity from 3 to 6 kHz (ie remove or bypass an SSB xtal or mechanical filter where fitted, or make up a ladder filter broad enough for AM).

I remember seeing (in the 1977 ARRL H/book) a detector which used two diodes. You kept both of them in for SSB and switched one out for AM.

>
> Would someone kindly explain the difference in the audio portion of the
> reciever.
> --
Basically no difference. However the DC receiver has most of its gain in the audio stages, so they probably have more gain (90-100dB) than is needed in a superhet's audio stage. Also, as the selectivity of a DC receiver is determined by its audio bandpass characteristics, it is desirable that low pass or band pass filters be inserted early in the receiver's audio chain.

Hi Gary, well it's definately a DC type arrangement 'cause the osc used
for the transmitter is coupled to the "mixer" via a small value
capacitor. A larger value capacitor connects from the same side of the
mixer directly to the AF amp. The other side of the mixer connects
directly to the top of an LC tuned circuit.

This has me very curious as to its performance so I'm going to build a
receiver based on this design and find out for my self. I'm still very
interested in any other comments from people though.

Cheers, Ian

As described above, this is what I call a 3rd order mixer. Normal mixing
makes use of 2nd order products (f1 +/- f2), whereas this configuration
uses 3rd order (f1 +/- 2*f2). Obviously, you get 3rd order non-linearity
with back to back diodes.

Performance can be quite good -- certainly better than most configurations
using bipolar transistors, although obviously not up to a properly
optimized 2nd order ring diode mixer, still less a FET switching type.

I have used these mixers in several commercial products. In addition to
the advantages quoted above, using a half frequency LO allows lower cost,
lower power, more available prescalers, especially for frequencies higher
than about 3 GHz. The absence of any transformers or baluns gives good
phase repeatablity, important for image reject mixers, for example.

The only thing to watch is that LO level is critical for optimun
conversion efficiency -- unlike a 2nd order diode mixer where, in general,
the more LO you have the less conversion loss you get.

In an application at 2.4 GHz, quoting from memory, I got about 6 dB conversion loss, 7 dB NF, and an input IP3 of about 0 dBm. Optimum LO injection was about -6 dBm. Not too shabby for a cheap pair of SOT23 Schottky diodes...

Good luck with the project,

Best,

Peter

:>damage is not consistent with HF energy. However, it is consistent
:>with what I would expect from VHF energy. In the photos of arced
:>bandswitches on my Web site, such is apparent.

The pattern is entirely consistent with HF energy. The Plate tuning
coil represents an impedence to RF of ANY frequency. Thus the (RF)
voltage across the coil (impedence) will be proportional to the
magnitude of the impedence from a given (high impedence) point to a
reference (low impedence) point. Since, in the case of an output
network, the low impedence point is the loading capacitor (or antenna
connector) the HF voltage across the coil, and thus the bandswitch, is
highest at the 10 meter contact, somewhat less on 15, still less on 20,
etc. The higher the voltage the bigger and more destructive the arc ...

:>BTW, last week on KTLA-TV, which is Channel 5 in LA, newsman Hal :>Fishman reported that
a TV-satellite which relays CNN and two other TV
:>networks was permanently knocked out by a front-ejection solar
:>disturbance, and that a number of military satellites were damaged at
:>the same time.

Fishman reported rumor and speculation. AT&T, the owner and operator of
Telstar 401 (the "TV satellite" in question) have stated that they

believe the problem to be due to a meteor(ite) impact which physically damaged the spacecraft's main power source. Otherwise, there would be some residual RF emission (one of several emergency beacons) and absolutely no RF has been detected from the craft.

If this had been due to circuit damage from high levels of charged solar particles, other TV satellites of the same design would also have been damaged, particularly those like Telstar 302 which were in orbital positions further to the east and which would have received even higher levels of charged particle bombardment.

Pathological science makes good stories for tabloid TV just like it sells snake oil for amplifiers and RCA still doesn't mark the "normal operating voltage range" on their filament meters.

Ok, that's not a reciprocating mixer since it uses an on-frequency
LO. Could it be that the second diode is used for TR? Perhaps this
is a single diode unbalanced mixer with the second diode DC biased
to act as a Rx TR switch or overload protector. I can't really tell
from your description how this circuit works.

Dear Rich....

This is the point I ws trying to make, and is the reason I mentioned ten-meters,
which would be a worst case example.

I believe Tom Rauch has shown that the plate tuning capacitor has very low reactance at VHF, and is actually slightly inductive at those frequencies.
If a VHF resonant circuit was formed by the internal capacitance of the tube,
combined with the series inductance of the Plate capacitor and the connecting
straps -- the VHF voltage at the plate tuning capacitor would be substantially
reduced based on the ratio of the inductances of the tuning capacitor and its connecting strap to the DC blocking capacitor.

Two bandswitches in Rick May's amplifier burned up their 10m contact while the amplifier was being operated on 80m into an antenna that exhibited no anomalies when driven by a Drake L-4B amplifier, at approximately twice the power level of the amplifier that burned up the two bandswitches. Rick installed bandswitch #3. It too intermittently arced like bandswitch #1 and #2. Rick decreased the VHF-Rp of the parasitic suppressor. He said that bandswitch #3 has not burned up from mysterious arcing. If you have any questions for him, Rick's e-mail address is listed on my Web site. Since December of 1989, more than 4500 suppressor retrofit kits have been sold by me. The guarantee: If the suppressor retrofit kit does not remedy the parasitic-symptom, the customer does not pay.

You did not address the issue of the damaged/kaput VHF suppressor resistor that often coincides with mysterious bandswitch arcing.

> I believe Tom Rauch has shown that the plate tuning capacitor has very

As I recall, Mr. Rauch measured the internal VHF resonances in a tuning capacitor. All tuning capacitors have them, Peter. Do VHF resonant circuits always exhibit low reactance at VHF?

A question: Peter--If you were designing an HF amplfier, would you want a VHF parasitic oscillation suppressor that exhibited more (or less) VHF-Rp than another type of VHF suppressor?

Rick:
If you believe that Gamma-rays, X-rays and Cosmic-rays are 'charged particles', count yourself among the 'better technical minds'.

If you believe that Wes' measurements of the characteristics of various vhf parasitic oscillation suppressors are virtually meaningless, you have yet another reason to count yourself among the 'better technical minds'.

If you don't have a clue as to how the algebraic expression (E1/E2)^23.4 was derived from Eimac's statement that a 3% rise in filament voltage causes a 50% decrease in the emissive life of the tungsten-dicarbide layer in a thoriated-tungsten cathode, count yourself among the 'better technical minds'.

If you believe that the formula for calculating the maximum RF current in a DC blocking capacitor, which appears on page 13.13 in the new *Radio Amateurs Handbook*, is correct, count yourself among the 'better technical minds'.

If you scored 4 out of 4, Rick, Congrats---you are thereby qualified to be a bona fide 'Recognized Amplifier Expert'--Apprentice. (contact Mr. Rauch or Dick Erhorn for further information)

It is true that, at this point, I seem to be burdened with more money than I will ever need in this life---and if Mr. Rauch makes good on his threat to sue me for libel, there is a pretty fair chance that this burden will increase even further.
It can be rightfully argued that this Apple Macintosh 2ci computer and my HP Laserjet-3 printer was paid for with monies from the business of selling mail-order VHF suppressor kits. I dutifully-deducted a fraction of the cost of this equipment from my taxable income (Section 179 of the U. S. Tax Code) because I use said equipment in the business . However, I have not

made a profit from selling suppressor retrofit-kits during the last 8 years. It's just a hobby, Rick.

> Only that we have been round and round ......
...snip...
Mr. Rauch has seemingly come down with a bad case of photonphobia.

In November, Mr. Rauch said:
__QUOTE
>The former *R+D engineering manager*, Buzz Miklos, of the Salt Lake City
>Varian plant has agreed to speak to one or two people on the telephone
>about your theories. He said he will also come on line, but since he just
>took a position as engineering manager with another tube manufacturer in
>PA, it will be sometime in January before he is able to connect directly
>to this newsgroup.
__END OF QUOTE
Mr. Miklos did not show up on this Newsgroup 'sometime in January', as proffered. No letter from Eimac has since been presented by Mr. Rauch that refutes the information provided by the Eimac/Varian Salt Lake division's personnel department regarding the job title of Mr. Joseph P. Miklos.

Mr. Rauch is somewhat understandably tiptoeing around the issue of Rp. IMO, Rp is the central issue in this discussion. Thanks to Wes (N7WS) Stewart's scientific measurements, we know what Rp is for the two principal types of VHF parasitic-oscillation suppressors at a number of frequencies in the VHF range. (see Figure 12 at
< http://www.vcnet.com/measures/>)
In Wes' measurements, Rp stands for parallel-equivalent resistance. For a VHF parasitic suppressor, Rp is representative of the VHF shunt load resistance presented to the anode of the amplifier tube.
Since voltage gain is basically Mu*Rp, more VHF-Rp means more VHF voltage gain. Conversely, less VHF-Rp means less VHF voltage gain.

The choice is yours, folks. If you want more VHF-Rp in your HF amplfier, suppressors made from copper are for you. If you want even more VHF-Rp, go for silver-strap suppressors, such as those found in the Kenwood TL-922 amplifier, and in Henry Radio amplifiers.
OTOH, if you want less VHF-Rp in your amplifier, according to Wes'

measurements, a nickle-chromium alloy VHF suppressor will produce the desired result---which is really nothing new. In the 1926 Edition of the *Radio Amateur's Handbook*, Mr. F. E. Handy wrote about it.

Mr. Handy was not the only person to arrive at this conclusion before I wrote the October1988 *QST* article "Improved Anode Parasitic-Suppression for Modern Amplifier Tubes". Around the time when I was in middle school, a ham club on the East Coast decided on a club-project of building copies of the first (4) 811A g-g linear amplifier that appeared in a ham magazine. All of the builders, except for one, followed the plans to the letter. The exception was Dr. William Riley., K4GXA. Riley concluded that, since the job of the VHF suppressors is to suppress, maybe a resistive conductor might be a good way to go. So, instead of using copper wire for Ls, Riley used hay-bailing wire for Ls. All of the club-project amplifiers eventually worked. However, over the years, mysterious things reportedly happened to the 811As in the other amplifiers. From time to time, sudden tube failures occured wherein 811A filaments were found in pieces in the bottom of the glass envelope. These tube failures were typically accompanied by a big-bang and an apparent arc. When Bill Riley eventually sold his amplifier 15 years later, his was reportedly the only amplifier that was still using the original (4) 811As. Bill told me that when the other amplifier builders first saw his rusty bailing-wire suppressors, they were amused. I suppose you could say that Bill Riley had the last laugh.

> that often coincides with mysterious bandswitch arcing.

I am not questioning the occurence of VHF parasitics -- and the fact
that they may occur at the same time other amplifier failures occur.
I question the "fact" that parasitics cause bandswitch
failure or tuning capacitor arcing. Consider Mr. Subich's and
Mr. Rauch's statements concerning the lowpass filter effect of the
ten-meter portion of the tank coil (a very high impedance at VHF).
How can damaging VHF voltages be present at the bandswitch? For
the lower HF bands, more (plate tank) inductance is involved,
and thus more impedance to the flow of VHF energy.

>>> I believe Tom Rauch has shown that the plate tuning capacitor has very
>>> low reactance at VHF, and is actually slightly inductive at those
>>> frequencies. (earlier post by Bertini)

> As I recall, Mr. Rauch measured the internal VHF resonances in a tuning
> capacitor. All tuning capacitors have them, Peter. Do VHF resonant
> circuits always exhibit low reactance at VHF?

No. I don't believe this is correct. I believe Tom showed the
capacitor to exhibit slight Xl at VHF frequencies. Not resonance.
Are you confusing reactance and impedance? Impedance is determined
by the resitive and reactive components of a device at a specific
frequency. For the tuning capacitor to be resonant at a given
frequency, it would need both capacitive and inductive reactances.
Given only it has a "slight" inductive reactance, its impedance
at VHF is most likely very minimal. I believe Mr. Rauch has
REPEATEDLY made this point. It is unlikely any further comments
on my part will sway you from your beliefs.

I do not understand your question regarding resonance and
low reactance. A resonant circuit may imply a high impedance
in the case of parallel resonance, or low impedance in the
case of series-resonance. It depends on
whether you are building a trap or bandpass circuit..
Rich, are you measuring series or parallel resonances with you
dip meter?

>A question: Peter--If you were designing an HF amplfier, would you want
a
>VHF parasitic oscillation suppressor that exhibited more (or less) VHF-Rp
>than another type of VHF suppressor?

Rich, I would honestly want a suppressor that did not compromise
the operating Q of the amplifier at HF frequencies.
I would select values of L, R and C (for the suppressor)
that were effective at VHF, and had minimal effect at HF.
That's where I would put my Q and RX meters to work.

I would also heed some of the other advice gathered in this thread,
and provide arc-over electrodes and current limiting resistors
in the plate supply.

Sins a long time i'm looking for a working sollution to receive and
decode the ACARS.

I have 2 different schematics and 2 different software packages. The
software is from AEA and the other from LOWE.

Some people says that the AEA software is working fine with a hamcom,
when i start the program, i see the data-indicator going on and off buth
the screen stay's empty. (ill try'd with squelch and volume settings
buth nothing works)

The LOWE needs a hardware key.

I'm thinking of bying a complete system with software and interface buth
is it going to work with my TH-79 from Kenwood (should i look for the
problem in the receiving of my Kenwood ?)
Still the litle interface from LOWE is to expencive.

MY QUESTION IS :

Are there any people out there who are working with homebrew interfaces
and what kind of software do they use with it ?
Are they welling to share the schematics and software ?
Sins there are not much people who are intrested in the ACARS system i
don't think to get lots of mail.

A SECOND HAND INTERFACE WITH SOFTWARE IS ALSO WELCOME !!

Thanks to all and ill hope my loking is going to end now :-))

William

Mr. Measures has a very selective memory, and a great ability to misapply simple and clear facts. His track record clearly proves this.

In this case, Mr. Measures is trying to distort the fact the capacitor goes through a minimum reactance at 150-200 MHz as evidence it must go through a maximum impedance at the same point.

He misquotes me just as freely as he has misquotes Varian, Dave Holtcamp, Marvin Born, and others.

Rich, you "forgot" I measured the voltage distributed through the tank.

Nearly anyone can make this measurement. Connect a VHF signal source at the anode and excite the tank. Measure (that word is becoming distasteful) the voltage along the tank with a high impedance RF probe, and you will see it behaves exactly as common sense would tell us. It is nothing at all like Mr. Measures would have us believe.

No one can be that stubid in the face of so much contrary evidence or even if conventional circuit theory is applied. This parasitic arcing theory of Measures must be an intentional hoax. In that case, any effort to communicate or argue with him is a waste of time.

If you clearly prove him wrong a dozen times in a dozen ways.....he'll keep going and going and going ....just like the mechanical Energizer Bunny on TV.

Hi Rich--

Speaking of formulas, how about this one: Obscure researcher makes an amazing discovery that works as a cure-all for a myriad of ills. Then, to market it, he attacks the establishment that somehow failed to understand and recognize the "real" truth. When confronted, he counters by crying conspiracy--and identifies a powerful special interest group who has much to lose by admitting he's right.

Just like E/I=R, this is a proven formula. Only, this formula is well know for marketing healing crystal, odd potions, and electric blood-vessel stimulators. Instead of burned switches, I think I'd rather see those elusive spectral displays that nobody seems able to produce (or reproduce) under controlled conditions. If the science is good, why would anyone need to conjure up anecdotal evidence, create enemies, and cry conspiricy?

> Since voltage gain is basically Mu*Rp, more VHF-Rp means more VHF voltage
>gain. Conversely, less VHF-Rp means less VHF voltage gain.

I tried starting a new thread on this issue, but didn't get any takers, so as Roy would say, I'll take a swing at this tar baby here.

I tried to connect to Rich's web site without success, so I can't address what is posted there. However, I have updated my page (http//www.azstarnet.com/~n7ws) with some charts which directly compare two suppressor networks.

For these measurements, the network is necessarily measured by exciting one end with respect to ground and measuring the characteristics. In this situation, the network is measured in a controlled (or well known) environment. The instrumentation is "smart" enough to remove any internal errors and present "corrected" measurement data. THIS IS NOT how the suppressor network is used in an amplifier.

The network is not an isolated device who's characteristics are independent of its environment. It is connected to the anode, which has an unknown source impedance, on one side and the output tank circuit, which has an unknown load impedance, on the other side.

Until these source and load impedances are known (at every frequency of interest) the effects of the suppressor network cannot be surmised.

I know this will sound heretical, but the more I look at this, the more I question the need for these things. If someone can present me a circuit

model in which the addition of a few ohms loss resistance can lower the loop gain enough to prevent an oscillation, I'd love to see it.

Mmmm... love them tar babies.

ARD is the ARRL Radio Software. You will see it advertized in QST and
QEX in most issues over the last 2 years. The files you downloaded are
likely ones for the analysis of circuits using ARD.

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version of my FTV software.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

A registered copy costs US$ 25. Registration promotes the further development of this software and entitles the user to future upgrades

paying only for delivery
expenses, if any.

Fianlly, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

> QSL via bureau UBA Belgium Hi Bill; you didn't say on what op system or PC you are
running this,
but there are several possibilites;

a. For most Windows users, you MUST run the ACARS software in a DOS mode. This does not mean a DOS box (as you can in Win95) but completly outside Windows. The reason for this is that ACARS and Windows conflict because each wants to control the serial port connection exclusivly. So you must exit Windows (yes, even '95) completly to run ACARS.
b. Leave your squelch completly open. The reason for this is because most squelches don't react fast enough, and part of the message will be lost before the audio reaches the interface.
If you are interested in getting more info on ACARS, come join us on majordomo@grove.net . Send a message like the following with nothing else in the body of the message;

subscribe acars
We also have a digest service (acars-digest) if you are interested in that. To my knowledge there has been no shareware development of ACARS software, but who knows that may change one day...73s Mike (colistowner, ACARS)

VHF resonances?
>
>>>> I believe Tom Rauch has shown that the plate tuning capacitor has very
>>>> low reactance at VHF, and is actually slightly inductive at those
>>>> frequencies. (earlier post by Bertini)

As I recall, Tom Rauch found some internal VHF resonances. However, this
is nothing new since variable-capacitor resonances are discussed in the
32nd (1955) Edition of *The Radio Amateur Handbook*.

>...snip... For the tuning capacitor to be resonant at a given
>frequency, it would need both capacitive and inductive reactances.

Do the tuning capacitor plates have inductance?

>Given only it has a "slight" inductive reactance, its impedance
>at VHF is most likely very minimal.

Quite true, Peter---unless the tune capacitor is resonant or near
resonance. Before this discussion began, I hadn't given much thought to
how VHF voltage might be able to arc a tuning capacitor. Thanks to Mr.
Rauch's measurements of a tune capacitor from an AL-80, I think I have an
inking.
Do you remember the problem I proposed of generating over 10,000vrms from
a 120v, 60Hz source with only one capacitor and one inductor? In my
solution to this problem, I picked an L/C combination that was
series-resonant about 0.6Hz away from 60Hz. Assuming that the L and C had
zero ESR, the circuit produced over 10,000vrms. Sure, it took around 100A
to do it. However, the typical filter capacitor in a typical 1500w amateur
radio amplifier has about 10 ohms of ESR. How much current is 2800V/10
ohms?

So why does the 10m bandswitch contact sometimes arc.? An open 10m contact probably has around 1 pF. The typical 10m section of a tank L has around 0.9uH. The series-resonant frequency is 170MHz. In an AL-80, this is in the neighborhood of the anode circuit's resonance at 160MHz. Thanks to Mr. Rauch's measurements, we know that the AL-80's tune capacitor has no resonances in that neighborhood. I have not heard of any case where an AL-80 tune capacitor allegedly arced. However, I have heard of a number of cases where AL-80 10m bandswitch contacts mysteriously arced and evaporated. If you're interested, photos of same are available at Figure 15 on my Web site.
>
...snip...
>Rich, are you measuring series or parallel resonances with you
>dip meter?

I do not know of a way of differentiating between a series-resonance dip and a parallel-resonance dip with a dipmeter.

>>A question: Peter--If you were designing an HF amplfier, would you want a
>>VHF parasitic oscillation suppressor that exhibited more (or less) VHF-Rp
>>than another type of VHF suppressor?
>
>Rich, I would honestly want a suppressor that did not compromise
>the operating Q of the amplifier at HF frequencies.

Did you accept someone's word that this was the case, or did you calculate a typical tank Q reduction, based on Wes' ESR measurement for a Ni-Cr Ls suppressor at 30MHz (4.32 ohms) and/or at 10MHz (0.88 ohms)? If you did the calculations, Peter, I would appreciate seeing how to do it, and how to calculate what the probable increase in harmonic output would be. I don't have a clue as to how to proceed. OTOH, I have heard of no cases where a low VHF-Q suppressor caused increased TVI to channel 2 during 10m operation---which would, according to Wes' measurements, would undoubtedly be THE worst-case. To date, I know of no instance where an FCC citation resulted.
Mr. Rauch made the claim that a serious HF Q degradation would result from using a Ni-Cr VHF suppressor.
Mr. Rauch presented me with the following problem. F=160MHz: An L of 85nH is paralleled with 100 ohms. How does the VHF current divide? According to AC Circuit Analysis, the calculated current through the 85nH L is about 10% higher than the calculated current through the 100 ohm resistor. However, Mr. Rauch concluded that these calculations are invalid. Do you accept Mr. Rauch's conclusion?

>I would select values of L, R and C (for the suppressor)
>that were effective at VHF, and had minimal effect at HF.
>That's where I would put my Q and RX meters to work.
>

I haven't seen a VHF suppressor design that uses a C. What does this circuit look like?

>I would also heed some of the other advice gathered in this thread,
>and provide arc-over electrodes and current limiting resistors
>in the plate supply.
>
In the Sept. 1994 QST critique of the Jan. 1994 QST article "The Nearly Perfect Amplifier", my suggestion about using a peak fault-current limiting resistor in the anode supply was pooh-poohed by the (self) 'recognized amplifier expert'.

An arc-over electrode sounds like a good idea, Peter. However, since tune capacitors, as well as open bandswitch contacts seem to arc during some intermittent VHF parasitic oscillations, IMO, at least two arc-over/spark-gap electrodes are indicated. Adding a low-L low-ohm MOF resistor in series with each spark-gap might help to limit the peak fault current. The Matsushita 3w-rated MOF resistors we use in our suppressor retrofit-kits might do the job. According to Wes, N7WS, the30 ohm units have around 9nH/0.009uH of internal L, and from my own tests I know that they have remarkable overload capacity.

The size of the carboy shouldn't matter since the fermentation process
is producing CO2. The CO2 is heavier than air therefore it should
procduce a protective blanket over the wort.

Jim

assuming that your rotator is of the DC variety it will possibly be
controlled by reversing the polarity to the motor. use a twin pole
changeover switch

The pot is propably to supply a variable signal to a meter to indicate
the rotator position and may also include as mine does a pair of end
switches to stop it turning more than 360.

I am in the same position as you and while I think I now know how to
control it, the metering arrangement is still theortical as I haven't
actually made the box of tricks yet.

hope this is of some help

A superhet *might* only have one oscillator. It might use an envelope
detector rather than a product detector (for AM), or it might use a
discriminator (for FM). A DC receiver can be considered to be just a
product detector with delusions of grandeur. Its "BFO" is also its
VFO, and the "IF" at which it works is the signal frequency.

>>What if I take the same circuit and use a 3MHz VFO and then put a 4MHz
>>crystal on the output of the NE602? Have I created a superhet?
>
>Yes. Its intermediate frequency is 4 MHz.

That doesn't seem to be what he's describing. The NE602 only has one
set of mixers, it can only do one conversion. If you put a 4 MHz crystal
on the 602 output, it would act as a series resonant pass filter for
4 MHz energy, IE act as an IF filter. It would not do a further
conversion. That requires both an oscillator and a mixer. You'd still
need to follow it with a product detector to get down to baseband. In
other words, you could use *two* NE602s, one as first mixer (with 3 MHz
VFO) and the second as product detector (with 4 MHz BFO), to make a 7 MHz
superhet with a 4 MHz IF.

Note that there's not much point to doing that unless you want to do
IF filtering and supply extra gain at IF with an IF amp. That's what
superhets normally do. The advantage of the superhet is that bandpass
filtering can occur at a single frequency, allowing use of high perfomrance
filters for single signal reception, and because gain can be supplied at
a single frequency, which is usually easier to do with good stability
than with a tunable amp.

The DC receiver supplies all its gain at audio frequencies, and unless
you use a quadrature scheme, won't allow single signal reception. The
high audio gain can also make the receiver subject to hum, noise, and
microphonics. But it is simple, and can work pretty well. It's no good
for AM or FM reception, however, since they don't use product detectors.

(You *can* do it if you use an I/Q scheme, and that's a powerful technique which can displace the superhet in some applications, but that is beyond the scope of this article.)

The third type of receiver is TRF (tuned radio frequency). It supplies all gain and selectivity at the *signal* frequency. This means all the amps have to be tunable, as do any selective filters. This sort of design is hard to stablize, and it is nearly impossible to get uniform selectivity response over the tuning span. Normally a simple diode detector would be used with a TRF design, but a product detector could be used if it has a tunable BFO, IE a DC receiver can serve as a product detector for a TRF receiver. This isn't generally a good plan, and TRF receivers have fallen from favor except for certain specialized uses.

Hi

I'm a new HAM and would like to build a portable 80m LSB Tx
anyone got any good ideas ?

Where can I find a good circuit diagram ?

Is there anything available on the net ?

1314. FS: Full Power Amp (80-10 Meters)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-02 00:00:00 UTC
From: "Jeffery A. Purtle" <jpurtle@smartlink.net>
Message-ID: <32F53C75.607D@smartlink.net>
Source record: 97721

The Amp has two 4-400 tubes in it in great condition and easily delivers an 1100 Watts carrier on CW with 100 Watts driving it. It has tuned inputs, which easily match it to the 80, 40, 20, 15, and 10 Meter Bands. It was built by a man named Cliff Kurtz, N6ZU, of Stockton, CA and he guarantees it for life. I know of a man who lives in Los Angeles that had Cliff drive all the way down here to fix it. It is built so heavy that nothing ever happens to anything he builds. I am selling it after moving into an apartment and having no need for it in the future as I see it, unless to make my neighbors mad.

Like I said I live in the Los Angeles area, Valencia to be exact and the price would not cover shipping. I would prefer pick-up to make sure the tubes don't get damaged in transport. I will also include a Swan WM-1500 Watt Meter.

I am asking $300.

Please contact me by phone: (805) 287-5953 or Email: jpurtle@smartlink.net

Thanks and 73,
de AC6IW
Jeff

That really helped alot. If you know where you can buy 1 - 2 pieces, let us all know. I've tried, and all they'll sell is an assortment, or 10 of the same devices. As far as the catalog goes, I've submitted my info several times, as well as live, in person at dayton. Have yet to see the designers catalog. That's the "reality" of the issue.

1319. Two chip DSB exciter

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-02 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <Pine.SOL.3.91.970202071010.5064B-100000@supreme>
Source record: 97789

Hello all - I'm wondering if anyone has tried building a two chip DSB exciter along the following lines:-

1. 3.58 MHz ceramic resonator oscillator (made variable) - using part of CMOS chip

2. Microphone amplifier - using part of CMOS chip - biased for linear operation

3. Balanced modulator made from 4016 or 4066 switch - it would work by switching the audio at 3.58 MHz

I remember building an experimental design a while ago, and got some results from it, but didn't take it any further. Adding extra components may make it useable for a phasing SSB generator.

I have built audio amplifiers using the 4007 chip. I had a lot of success with them. They seem to have built in audio compression, and didn't draw a lot of current. Possibly this could be put to use in the transmit section, with the stage providing a degreee of audio compression that would improve readability but not contribute to distortion.

Your thoughts please!

>
>think I understand that part but:

A superhet has at least two oscillators. The last is frequently called the BFO. A tunable oscillator other than the last is a VFO. The direct conversion receiver has one, so you get to call it either one you like.

>
>What if I take the same circuit and use a 3MHz VFO and then put a 4MHz
>
>crystal on the output of the NE602? Have I created a superhet?

Yes. Its intermediate frequency is 4 MHz.

> In addition, now that I've mixed the signal do I get conversion gain from
>
>the NE602? Do you get the same gain when using it in DC operation?
>
Yes, you do get conversion gain from the NE602. The NE602 doesn't know whether the signal at its input is the result of a previous conversion (that is, the input is an IF of a superhet) or is coming directly from an antenna (that is, it's being used for the conversion in a DC receiver). So the gain is the same for the two cases, all else being the same.

>I hope these questions are not too far out in left field.

Not at all. You might take a look at "Solid State Design for the Radio Amateur" by Wes Hayward and Doug DeMaw. It's available from the ARRL, and has some good information about receivers, including direct conversion. As I recall, Paul Carr, N4PC, published a series in CQ about a year ago which described the construction of a DC receiver which later became the last conversion of a superhet.

I don't think the use of a current-limiting resistor was the subject
of criticism. It was, rather, the type of resistor used. A
current-limiting resistor is almost always a good idea. Using the
wrong kind of resistor is almost always a bad idea. Using a resistor
that's too "small" is sorta like using the low-voltage fuse in a HV
line.

>Is there a recommended and/or quick'n easy method
>for testing voltage, amps, and longevity?

Gell-cells have a limited lifetime, Bill. That's why they are replaced on a regular schedule in UPS service. It is often possible to get more use out of them, but realize they are in their declining years and don't depend on them for anything mission critical such as ARES.

Gell-cells use lead-acid technology, so they need to be charged with a constant voltage charger. But due to limited electrolyte mobility, charge current needs to be limited too during the initial stages of charging, IE when the battery is nearly flat. A good rule of thumb is to limit charge current to 0.1*C where C is the battery's amp-hour capacity. As charging progresses, gradually switch to constant voltage charging and let the current taper off to trickle levels as the cells reach full terminal voltage.

Now, after the batteries have taken a normal full charge (if they won't, you've got candidates for the recyclers), you can test them for capacity with a load test. First assure yourself that they have rated terminal voltage. Fresh off the charger, a 12 volt battery should show about 13.8 volts no load. This is a result of "surface charge", and is normal. After applying a brief load, voltage should drop to 12.5 volts. This is also normal. Now load the battery at a 1*C draw (series parallel strings of auto lights or power resistors can be used to achieve this), and monitor terminal voltage and time. When terminal voltage drops to 10.5 volts, stop and note the time. It should be near 12 minutes. If it is, you have a good battery. If it is substantially less than 12 minutes, you have a weak battery with little remaining life.

What this test is doing is seeing how long it takes to extract 20% of battery capacity. That's all you can safely extract from this sort of battery without risk of permanently damaging it. By loading it with the 1C rate, it should take 60 minutes to fully discharge it, and 12 minutes to 20% discharge it. The 10.5 volt terminal voltage is the lowest terminal voltage to which you can safely discharge this type of battery, so

it serves as the termination point of the test.

Never try to draw more than the 1C current from a gell-cell. They aren't designed to tolerate rapid discharge. Note that this same test can be performed on liquid electrolyte lead-acid batteries, but they're tougher, and can tolerate short duration high current draws. You may want to test that too. Attach a 10*C load and monitor terminal voltage. It should remain above 10 volts. If it sags to less than 8 volts in less than 10 seconds, the battery has high internal resistance and shouldn't be depended upon for starting duties. (Don't do the heavy discharge test for more than 10 seconds at a time or the battery plates may warp.)

These tests should be performed at normal room temperature. The batteries will have substantially less performance at lower temperatures. Six volt batteries can be tested in similar fashion, just divide all the voltages given above by 2.

Hi Wes,

Good to see someone taking this thread back to science.

In article <n7ws.253.008366FC@azstarnet.com>, n7ws@azstarnet.com (Wes Stewart) writes:

>For these measurements, the network is necessarily measured by exciting one
>end with respect to ground and measuring the characteristics. In this
>situation, the network is measured in a controlled (or well known)
>environment. The instrumentation is "smart" enough to remove any internal

>errors and present "corrected" measurement data. THIS IS NOT how the
>suppressor network is used in an amplifier.

Absolutely.

>The network is not an isolated device who's characteristics are independent
>of
>its environment. It is connected to the anode, which has an unknown source
>impedance, on one side and the output tank circuit, which has an unknown load
>impedance, on the other side.

Ahh, but I do know those impedances. And you can too if you have a PA and a Network Analyzer. They are no big secret.

The effect of the other circuit componets is to bring Q and impedance of both parasitic suppressors to higher but converging values.

>Until these source and load impedances are known (at every frequency of
>interest) the effects of the suppressor network cannot be surmised.

I measured Q in a pair of 3CX800's,and with a suppressor Q of unity outside the PA the Q climbed to over three with the suppressor in the PA. Adding the Measure's voo doo nichrome suppressor exactly as described in his paper resulted in almost the same Q, except just ever so slightly higher than the stock suppressor.

I will give Rich credit, his nichrome did lower the UNloaded Q of the tank nearly 50% on one frequency of interest, ten meters. So it isn't like it's complete voo doo. If the PA oscillates on ten meters, it might settle it down.

>I know this will sound heretical, but the more I look at this, the more
>I question the need for these things. If someone can present me a
circuit
>model in which the addition of a few ohms loss resistance can lower the
loop
>gain enough to prevent an oscillation, I'd love to see it.

It can indeed Wes. Even a Q of three or four is enough to damped the system at VHF.
Some PA's are totally stable without ANY suppressor, and some require a large suppressor. There are so many variables involved a universal suppressor system is impossible to define.

This is why I had to spend almost as much $$$ as Rich makes off his snake oyl cure to get the right equipment. While I could do it by cut and try, it's much nicer to know what you are really doing.

Now if I had uncanny ESP that allowed me to, just by holding a part in my hand, see the cause of the parasitic, if I had a rare Q measuring GDO, if Varian would have whispered the hiiden truth in MY ear in one of the hundreds of conversations I've had with them that they ONLY told Mr. Measures (NEVER have they told this parasitic stuff to anyone else in the world...just their best friend Mr. Measures. Strange, isn't it?), if I thought oscillators were self-destructive gongs waiting to be rung by a photon from the sun, if I knew so little about field theory that I believed a parasitic could melt the glass of a Chinese tube, than I would probably just throw something in and call it a done cure.

I'm not blessed with those features, and do not (through experience with pathological liars in my family) understand how to predict when someone else is lying. So I'm stuck, I just have to make actual measurements.

If you'd like to have a PA to measure, let me know. You hit the tar baby. I need to go away and do something more constuctive. You do not get to keep it though, hi.

In a message R. L. Measures writes:

<< Peter: Have you ever checked a tank L with a dipmeter for the presence
of
VHF resonances?

No. What would it prove? My dipmeter is the most unused item in the
shop.

>
>>>> I believe Tom Rauch has shown that the plate tuning capacitor has
very
>>>> low reactance at VHF, and is actually slightly inductive at those
>>>> frequencies. (earlier post by Bertini)

< As I recall, Tom Rauch found some internal VHF resonances. However,
this
< is nothing new since variable-capacitor resonances are discussed in the

< 32nd (1955) Edition of *The Radio Amateur Handbook*.

>...snip... For the tuning capacitor to be resonant at a given
>frequency, it would need both capacitive and inductive reactances.

< Do the tuning capacitor plates have inductance?

The question should be "do tuning capacitors have a parallel
resonance at VHF?"

>Given only it has a "slight" inductive reactance, its impedance
>at VHF is most likely very minimal.

< Quite true, Peter---unless the tune capacitor is resonant or near
< resonance. Before this discussion began, I hadn't given much thought
to
< how VHF voltage might be able to arc a tuning capacitor. Thanks to Mr.
< Rauch's measurements of a tune capacitor from an AL-80, I think I have
an
inking.
< Do you remember the problem I proposed of generating over 10,000vrms
from
< a 120v, 60Hz source with only one capacitor and one inductor?

Nothing new there, Rich... there is a whole new disipline based on that
principle. It's called switching power supplies.

< So why does the 10m bandswitch contact sometimes arc.? An open 10m
contact

< probably has around 1 pF. The typical 10m section of a tank L has
around
< 0.9uH. The series-resonant frequency is 170MHz. In an AL-80, this is
in
< the neighborhood of the anode circuit's resonance at 160MHz. Thanks to
Mr.
< Rauch's measurements, we know that the AL-80's tune capacitor has no
< resonances in that neighborhood. I have not heard of any case where an
< AL-80 tune capacitor allegedly arced.

Bingo!!!!! Of course not!! It is virtually a dead short at VHF! Sort of
kills
the possibility of VHF energy arcing the bandswitch.......

< However, I have heard of a number of
< cases where AL-80 10m bandswitch contacts mysteriously arced and
< evaporated. If you're interested, photos of same are available at
Figure
< 15 on my Web site.

The winds are a shifting. Last week, when I mentioned ten meters, you
went on to say this happened on 40 meters, not ten meters.

>>A question: Peter--If you were designing an HF amplfier, would you
want a
>>VHF parasitic oscillation suppressor that exhibited more (or less)
VHF-Rp
>>than another type of VHF suppressor?
>
>Rich, I would honestly want a suppressor that did not compromise
>the operating Q of the amplifier at HF frequencies.

< Did you accept someone's word that this was the case, or did you
calculate
< a typical tank Q reduction, based on Wes' ESR measurement for a Ni-Cr Ls
< suppressor at 30MHz (4.32 ohms) and/or at 10MHz (0.88 ohms)?

Rich, I am confused. You are marketing this product, and have been
for years. You mean that thanks to Wes' calculations you only now
have some idea of what they doing?

< the probable increase in harmonic output would be. I don't
< have a clue as to how to proceed. OTOH, I have heard of no cases where
a
< low VHF-Q suppressor caused increased TVI to channel 2 during 10m
< operation---which would, according to Wes' measurements, would
undoubtedly
< be THE worst-case. To date, I know of no instance where an FCC citation
< resulted.

Spectrum analyzer? They are fairly cheap.

< Mr. Rauch made the claim that a serious HF Q degradation would result
< from using a Ni-Cr VHF suppressor.

Yes, it should. While the impedance of your suppressor would change
to a lower value at HF due to a decreasing XL, the resistive component
of the wire remains constant -- the resistive element will absorb power
at HF. Why waste time silver plating tanks coils when we are going to
place resistors (nichrome or otherwise) in series? There is a difference
between loaded and unloaded Q...

< Mr. Rauch presented me with the following problem. F=160MHz: An L of
< 85nH is paralleled with 100 ohms. How does the VHF current divide?
< According to AC Circuit Analysis, the calculated current through the
85nH L
< is about 10% higher than the calculated current through the 100 ohm
< resistor. However, Mr. Rauch concluded that these calculations are
< invalid. Do you accept Mr. Rauch's conclusion?

Rich, the math and caculations have been gone over, and over, and
over....
Do you disagree with Rauch's math? Argue with him.

>I would select values of L, R and C (for the suppressor)
>that were effective at VHF, and had minimal effect at HF.
>That's where I would put my Q and RX meters to work.
>

< I haven't seen a VHF suppressor design that uses a C. What does this
< circuit look like?

Mr. Rauch described a suppressor using RCL components in an earlier
post. I did not retain a copy. I am sure Mr. Rauch would reply if asked
--
nicely:)

>I would also heed some of the other advice gathered in this thread,
>and provide arc-over electrodes and current limiting resistors
>in the plate supply.
>
< In the Sept. 1994 QST critique of the Jan. 1994 QST article "The Nearly
< Perfect Amplifier", my suggestion about using a peak fault-current
limiting
< resistor in the anode supply was pooh-poohed by the (self) 'recognized
< amplifier expert'.

I am surprised. I would use them regardless of Mr. Rauch's alleged
comments. I think you had a good idea there.

< An arc-over electrode sounds like a good idea, Peter. However, since
tune
< capacitors, as well as open bandswitch contacts seem to arc during some
< intermittent VHF parasitic oscillations, IMO, at least two
< arc-over/spark-gap electrodes are indicated. Adding a low-L low-ohm MOF
< resistor in series with each spark-gap might help to limit the peak

fault
< current. The Matsushita 3w-rated MOF resistors we use in our suppressor
< retrofit-kits might do the job. According to Wes, N7WS, the30 ohm units
< have around 9nH/0.009uH of internal L, and from my own tests I know that
< they have remarkable overload capacity.

The peak limiting resistance belongs in the plate supply feed. You refuse
to
accept the fact that a plate tuning capacitor can be effectively
a dead short at VHF, but readily assume that a Matsushita MOF is a pure
resistance, free of resonances at VHF?

Let's put one on a RX meter and see what it looks like at VHF first.

1334. Buzz Milkos and Amplifier Tips

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-03 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <32F54E46.4F11@tri.net>
Source record: 97737

Boy this discussion has been going on a long time and has degenerated.

I don't know Buzz personally, just met him at a CSVHF conference where he presented an excellent talk on using one of the Eimac tubes on 1296. He stayed up late several nights discussing tubes and amps in general with anyone having questions.

WB0DRL built several of the amps and actually had some CNC versions machined. Fried a couple of tubes, Buzz was right there with replacements and dissected the dead at the factory to help with the design. As I recall, he had several made with water cooled jackets to see what Pete could do with those (I suspect you have to be somewhere in the chain of command to get that done for Ham purposes).

Anyway, he is/was a great guy and if he happened to lurk here a while before joining the discussion, I suspect he is now under deep cover.

Greetings from the land of eternal summer;
Im looking for an old 1500/1700 Kcs. IF xfmer with can. Im building an old tube type ham brew regen. receiver with the regen in the IF. The were the supergainers of the 50s. Is there any help out there?
I have two part numbers;
Miller #612-W4 1600 Kcs.
Millen #62161 1700 Kcs.
Any help will be greatly appreciated. So will the young kids at the next local home brewers meeting next. At least I can give em a progress report. Im ok for a reasonable cost es postage.

Hi All,

We're looking for a Solid State Grid Dip Meter, either new or used (Millen unit prefered). Delivery is to Israel. Can anyone help?

When responding, please email directly in addition to posting here, since our news server isn't very up to date. Please note that you must edit the reply email address (remove the .NOSPAM postfix). This has been done in an attempt to reduce the amount of junk mail received here from automatic mailers. Thank you.

regards,
techno

I have an old "Archerotor" controller - probably from Radio Shack -
which you can have if you pay the shipping. It is dirty and the case is a
little bent but the insides look fine. I have no idea if it will work
with your rotator.

In an article in the January, 1974 issue of Ham Radio, W4QQ has a 4-1000A 5-band Kilowatt Linear that uses a suppressor consisting of:

A 20 pf ceramic capacitor (Centralab 852S) which is a mini-doorknob with axial leads in parallel with 4-470 ohm 2 watt resistors and 4 turns #12 wire, 1/2 inch diameter, resonated at 110 mhz. I built that amp project in 1981, and it has performed flawlessly ever since, with the original parts and tube.

Hi All,

Bought a Cleartone CM6500 PMR set yesterday, very cheaply too, just wondering if it's possible to mod the radio into the 70cm's band, and also where I can find any information to do this. Unfortunately, there is nothing obvious inside like a diode matrix or Eprom, so any help would be gratefully accepted.

Thanks in advance and 73's de G7UOZ, Max.

.
Measures now comes out and admits he hadn't given much thought to how a VHF parasitic could cause an arc in a tuning capacitor. He just went right ahead and said it could for years and years, without even thinking about it.

Now, after YEARS of making his claims, he admits he is just beginning to think. He now has an "inking."

What is an inking? Peter, do they ink people at Belvue? Answer the question Peter.

Do you think Rich checked out other parts of his theories as well as the plate capacitor he admits never even thinking about?

I wonder if this has anything to do with the stuff he incorrectly posted from Born? And about Miklos job? And from Holtcamp on the 922? Or about the filament meters and variacs? Or those 500 watt 8877 grids? Or his cat and a popular perfume?

Do you suppose Rich never bothers to check anything out? Is it possible he just makes stuff up or thinks he hears something, and decides in his mind it's true enough to repeat as a fact before he even understands it?

Let's look at what was actually printed.

Rich's suggestion to use a 10R resistor for up to 3kV was criticized because it isn't enough to make a significant difference to the internal resistance of the power supply. The specific point was that the ESR of the electrolytic capacitors is likely to be at least 10R, and then there's the RF choke and other series components.

I wasn't mentioned in QST, but Eimac Application Bulletin #17 recommends 50R for "small" transmitting tubes that run at about 2kV.

In other words, the criticism was not about the recommendation to use a resistor; the point was that 10R isn't high enough.

-exempt from your interpretation?
-
-73
-
-Rob

I think you misunderstand me (or maybe I misunderstood Ted)
I took Ted to be one who was for free speech and all but who
also was for following the law. My interpretation of Ted's
position was that he was against anyone using equipment
to jam CB. It is ILLEGAL to jam anyone on any service.
If you mean that Ted's is trying to shut people up because
he doesn't want them to jam others then YES I agree with him.
Jamming is illegal. If you want the leftist-liberal spin on
jamming, it is just like censorship. You, by jamming someone,
are censoring what he is saying. This can be equated to
censoring text by blotting out portions. So, by being for the
"rights" of people to jam others then you are for censorship.
Kind of hypocritical, isn't it? But then most liberal positions
are. They are for free speech unless it offends them, they are
they are against discrimination unless it benefits them, they are
for higher taxes (for the "rich") but not for them.

Liberals measure their compassion by counting the number of people
they are helping. Conservatives measure their compassion by
counting the number of people who no longer need their help.

Anyway, enough of this off the subject stuff.

The switching power supplies that I am familiar with switch DC at a 50KHz
or so rate into a toroidial transformer, whose secondary windings are
rectified, filtered, and sampled by a comparator that proportionally
controls the switcher to maintain the desired DC output voltages.
It seems to me that a closer analogy is the L-network. An L-network is
basically a series L/C circuit that is operated slightly off-resonance. In
the problem that used one L in series with one C to generate 10kV at 60Hz,
the two reactances were one ohm apart at 60Hz. Thus, with 120v @60Hz
applied, over 100A of current passed through L and C. Since the reactances
were approx. 100 ohms, the voltage across either reactance exceeded the
goal of 10kV.

Sure, a circuit that is series-resonant is a virtual dead short, but ONLY
at the frequency of resonance. Is a circuit that is series-resonant at
170MHz a virtual dead-short at 160MHz? Not in my opinion. It seems to me
that this situation is similar to the example of generating 10kV from a
120v, 60Hz source with an almost series-resonant circuit. ....Please
double-check your bingo card before coming to the pay-window,
bingo-players.

I talked about how VHF parallel-equivalent resistance (Rp) determined VHF
voltage gain in "Parasitics Revisited" (9/90-10/90 QST). I knew that Rp
decreased with Ni-Cr alloy conductors as frequency increased, but I did not
have the test equipment to make measurements at the frequencies where VHF
parasitic-oscillations typically take place. Seven years later, Wes
Stewart made the measurements that I needed when I wrote the manuscript.
>
> < Mr. Rauch made the claim that a serious HF Q degradation would result
> < from using a Ni-Cr VHF suppressor.
>
> Yes, it should. ...snip...

We have 4.32 ohms in series with 5pF (the anode-C of a 3-500Z) of the
total tune C of 5pF +15pF=20pF at 30MHz. At 30MHz, 5pF has about 1100 ohms
of reactance. How can 4.32 ohms of R in series with 1100 ohms of Xc cause
a 'serious HF Q degradation' when 75% of the HF tank current at 30MHz does
NOT pass through the 4.32 ohm resistance? Please show us the calculations,
Mr. Bertini and/or Mr. Rauch.

> < Mr. Rauch presented me with the following problem. F=160MHz: An L of

> < invalid. Do you accept Mr. Rauch's conclusion?
>
> Rich, the math and caculations have been gone over, and over, and
> over....
> Do you disagree with Rauch's math? Argue with him.
>
Mr. Rauch most likely did NO mathematical calculations, Peter. If he had,
he assuredly would not have given me a problem that disproved his
intransigent assertions that insignificant VHF current flows in Ls.

In the 9/94 QST (in regards to VHF suppressors) Mr. Rauch said:
---"The coil's reactance increases with frequency, and at VHF most of the signal path is through the resistor. It is plainly evident that the dominant component at VHF is the resistor, not the coil."---
Apparently, self-recognized 'experts' are reluctant to acknowledge mistakes they make.

So, Peter: Do you accept Mr. Rauch's statement regarding the VHF current in Ls as fact? If you do not accept it, then why do you accept Mr. Rauch's assertion that "...changing the resistance of the suppressor's coil radically affects the HF circuit Q." (9/94 QST)

IMO, any electronic engineer who rejects AC Circuit-Analysis, and instead solves such problems by intuition, quite probably does not have both oars in the water.

..snip...

BTW, I am still waiting for one of the naysayers to provide us with the values of a copper-wire suppressor that equals the performance of a suppressor made from resistance-wire. ..... The time has come to stand and deliver. What will it be--deliver or quiver?

I suppose it is possible, but that airplane had better be very nearby. The problem, you see, is that most airplanes don't transmit with more than 10 watts --and that's using AM! Another problem is getting enough selectivity to seperate the signals. That's an easy thing to do with AM broadcast: the band is over several octaves wide. The aviation band, on the other hand, is quite difficult to make a reasonable TRF filter for...

Interesting, Phil. Was the anode-circuit resonance in this amplifier also 110MHz? Did the author explain the purpose of the 20pF capacitor? How much DC anode voltage do you use? Does this amplifier/suppressor perform satisfactorily on 10m?

Peter Parker (parkerp@pcug.org.au) wrote:

: Henry - yes it should be possible. The main limitation would be the
: extreme deafness of the receiver. You are right in that a crystal set for
: VHF is just the same as one for MF, but with a smaller tuned circuit
: (4-6 turns around a pencil and a 2-20pF trimmer should be about right for
: the air band - but remove the pencil after you've wound the coil).

: It is possible to increase the sensitivity of a crystal set by applying
: bias to the diode. Also some audio amplification (say using a 741 chip)
: will be useful.

Although bias is useful for making an AM detector more sensitive, I think you can do fine without it. HP makes "zero-bias video detector diodes" that are optimized just for this sort of thing. I find that I can detect RF on 2 meters down to around .2 millivolts with an unbiased detector, and the op amp I have following it isn't all that wonderful about drift. I think with a really good op amp (extremely low input bias current and extremely low drift) it would be possible to get down to some tens of microvolts. (I use this as a sniffer on fox hunts, and find I can "hear" a 1-watt transmitter from 1000 meters or more, if it's line of sight.) Listening to the demodulated output from an AM signal is easier, since you don't need to maintain DC stability. If you do want to use bias, be aware that there is an optimum...see the HP application notes on video detector diodes for more info. (I wouldn't use the 741 for any serious audio-type application...there are much lower noise amps available, and be sure to use something optimized for the source impedance the detector offers if you want best performance.) One serious problem will be that with careful design for _sensitivity_, you are likely to find you don't have good enough _selectivity_! A front end filter with two coupled resonators is likely to give a lot better results if you are in a high-RF area such as a major airport.

Huh? I get onesies and twosies of things all the time from
Mini-Circuits, and have stacks of documentation from them too.

They *do* have minimum orders, and they *do* have MOQs on things like
MMICs. So what? Either order them from somebody else, or order a pack
of (for example) MAR-6s and make yourself popular by giving the rest
away.

If you ask nicely, I've known them to waive their minimum order for
hams. But the additional processing involved affects the price of the
toys we buy, so why not get together with some friends and put toget
her a more substantial order? It doesn't take *that* many SBL-1s (or PO
S-150s, for that matter) to make 50 bucks.

1355. NEED CURCUIT THAT WILL SUPPLY 12 VOLT DC PULSE BETWEEN

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-03 00:00:00 UTC
From: hq54@aol.com
Message-ID: <19970203200901.PAA15985@ladder01.news.aol.com>
Source record: 97808

Hi,

I looking to build a cercuit that can monitor a batteries voltage, and when that voltage falls below a predetermined voltage, in this case approximately 9 to 10 volts, will supply a pulsed 12 (or 9 or 10 volts) for a duration on 50 ms to 1 second. If any body can help me, or needs any more info regarding my needs for this cercuit, feel free to E-Mail me.

Thanx in Advance
Mike

Really like it. If you act fast you can pick one up for less than $400. The replacement rig VM-7A costs $600. The 733 will do more than you want it to. It takes a little while to learn to program it, but for mobile operation it is very smooth. I do not think you will be disappointed. The new 7A is missing one very important feature of the 733 - MUTE. The 7A appears to be very popular except for that. MUTE will decrease audio in the non-control band -20dB if audio is in primary band. Very helpful feature if you casually monitor a freq while listening for a call on other band. You will hear everything on both sides of this fence, but for inexpensive mobile rig - this is it!!!

>and deliver.

Rich is referring to me; but I'm not a naysayer - I'm a skeptic.

This all arose from an off-newsgroup discussion after I'd plotted the N7WS measurements of the three different suppressors on graphs (that's two of Rich's NiCr models and a conventional one from W8JI).

The Q vs frequency graphs are plotted on a log-log scale to emphasize the ratios between the three different units.

>What will it be--deliver or quiver?

Neither.

As Wes, N7WS points out in his revised web pages (http://www.azstarnet.com/~n7ws):

"at VHF, there are only slight differences between the effective parameter values for the two types of networks."

All that I was saying to Rich was that if he wanted to make the conventional suppressor have *exactly* the same Q as one of his, at any desired frequency, he only needed to shift the whole curve up or down by a small amount (this being a useful property of the log scale).

I never did offer to "provide us with the values of a copper-wire suppressor that equals the performance of a suppressor made from resistance-wire" so Rich would have waited a long time for that!

Meanwhile Wes has already done what he asked, on his revised web page:

"Some mathematical manipulation can demonstrate that shunting the conventional suppressor with additional resistance will bring the curves into better alignment. An additional 250 ohm resistor in parallel with the network will cause the Rp curves to nearly overlap the nichrome curves above about 30 MHz. Below 30 MHz, the Rp of the adjusted conventional type will be higher than the Rp of the nichrome device."

So now Rich can cross this one off his list.

Hi there,

I have put a "Ham Radio" page on my personal homepage. It includes some hints and tips to do with our hobby. You are welcome to visit the site at

http://indigo.ie/~murf

If you have any other hints and tips regarding amateur radio, please email me with a view to putting them on my site with credit of course.

Alternativly, if you have any good ham pages that I could link to, then these too are most welcome.

73`s for now

>Thanks,
>Barry Newberger

You see this written from time to time. I happen to disagree with this opinion, as a general matter. It sounds reasonable to drive mixers with a square wave since one is trying to switch the diodes on and off. The reality is that square waves do not go through transformers very well, so you should really stick with a sine wave in most cases. What really makes mixers happy (at least below 100 MHz.) is to be driving from a current source of sine wave.

Another problem with square wave drive is that if you don't make the duty cycle exactly 50%, you degrade the mixer performance. It's easier to make a distortionless sine wave (with a low pass filter) than a perfect square wave.

If someone has a square wave success story, post it here and I may breadboard it and A/B it with my favorite drive circuit.

Have been looking at a new active mixer from Analog Devices (AD831)

They call it a low distortion mixer. Following are some specifications.

+24 dBm 3rd order intercept
+10 dBm 1 dB Compression Point
-10 dBm LO drive

The LO input is through a high gain, low noise limiting amplifier that
converts the -10dBm LO input into a square wave.

The NE602A, also a Gilbert cell mixer, has -13dBm for a 3rd order intercept
and the 0 dBm at 1 dB compression.

You have to watch out at every turn Peter, just like when he said claimed
I said using a resistor was a bad idea. Keep in mind he just says things.

The stuff above is a good example, Mr. Measures ignores several things.
Let me give you a hint to ask him about just one of them, the effects of
the series inductance in the path from the tank to the anode.

Arguing a complex circuit with five or ten major reactances should only
take a few months of time. It will take at least five exchanges of
spitting and hissing to get path inductance correct. Bet on it.

>
>So now Rich can cross this one off his list.

Mr. Measures magic nichrome suppressor is equal to a the Q a stock AL-80A suppressor with a 71 ohm resistor would have, instead of the 100 ohm resistor used.

Say, isn't that some improvement ?? Years of promoting how much lower the VHF Q is, and it's almost nothing.

The PA goes from a oscillating arcing nightmare, to a stable smooth perfect PA by adding an "invention" that lowers anode SYSTEM (look, I said system) VHF Q from about 3 to a new total of 2.9! Not only that, Measures SWORE he could measure that change clearly on his super dooper Q indicating GDO that is better than any network analyzer.

Rich, why not sell your customers a 68 ohm resistor for $50. It's a bigger improvement yet, so you should be able to charge even more $$$ for it! Maybe QST will run another article, describing how a change to a 68 ohm resistor will:

1.) Stop melting glass in Chinese tubes.
2.) Stop bandswitch arcing.
3.) Stop other tube failures like damaged, melted. bent or twisted grids or filaments.
4.) Stop meter failures.
5.) Stop plate choke failures.

ALL while making the PA notably easier to tune.

Perhaps someone in California is just having fun and at any moment is going to shout, "April fool"?

>that's too "small" is sorta like using the low-voltage fuse in a HV
>line.
>
>

That's correct Fred. The non-surge rated resistor Measures suggested was a ten ohm 700 volt rated component.

FOr about two dollars more, the user could purchase a 35 ohm surge rated componet that would withstand fault impact without damage, and wouldn't arc internally from end to end.

The other problem was with Mr. Measures calculations. He assumed the ESR of the supplya and the entire poath was zero ohms in his example, when in fact it is much higher. In a typical PA like the AL-1200 the fault path ESR is about 12 ohms as is WITHOUT any resistor.

Adding a ten ohm resistor would lower fault current from 291 amperes to 159 amperes IF the resistor did not arc internally. Big deal.

Adding a correct style 35 ohm resistor would lower fault current to 75 amperes. That's a good improvement.

Adding the wrong type of 10 ohm resistor is a waste of time, unless the PA has a big oil filled cap, low resistance plate choke, and ypou are very lucky in a fault condition and the resistor does not arc internally.

Like in other areas, Measures clearly understood the point I made but chose to distort the data. It's a habit I guess.

"carl.ratcliffe3@virgin.net"@virgin.net writes:
>I'm a new HAM and would like to build a portable 80m LSB Tx
>anyone got any good ideas ?

There are three basic ways to make a SSB transmitter. There is
the filter method, the phasing method, and the third method
(also called the Weaver method).

You can find examples of the filter method in almost every
modern commercial SSB radio. The phasing method found favor
in the early days, and it has recently made a comeback. Rick
Campbell's R2 and T2 use the phasing method, and a few DSP
based commercial radios do too, though it is well hidden in
the firmware. It is elegant and rather simple to implement,
but until recently it was hard to implement *correctly*.
The third method is also simpler to implement today than
in the past, but hasn't gained any real popularity.

The filter method requires superhet design, and a fairly
expensive filter. For a multiband rig, superhet doesn't
add much cost, but the filter does. The phasing method
can work directly on the desired frequency. This can
simplify design and cut costs, especially for a monoband
transceiver. You can even do the phasing at high level
and avoid the necessity of linear RF amplifiers to bring
the signal up to useful levels. With the filter method,
you have to do the SSB generation at low levels and follow
that with a chain of linear amplifiers. The hard part of
the phasing approach has been to generate precise quadrature
in the audio modulation.

That's been difficult because the audio spans a couple of
octaves, but all of it must be precisely phase shifted by
90 degrees. Complex RC networks were used in the old days.
B&W made a commercial phase shift network which was used in
many old designs. There have been a few later attempts to do
the phase shift with active filters, but complex RC networks
are still needed. Campbell's design uses such a network.

The reason that the phasing method has regained popularity is
that it is now trivial to get the necessary quadrature via a
Hilbert transform using DSP. With modern radios adopting DSP
for processing the received signal in transceivers, it is
logical to also use the DSP on transmit to develop the necessary
quadrature for SSB transmission. This is not expensive, only

a few extra lines of code, and the resulting radio can actually cost less than the filter method while having equal or superior performance.

I've been using part of the R2 design with an Analog Devices DSP evaluation kit to make a high performance receiver for arbitrary modulations. It would be trivial to apply the same approach to the T2 and yield a SSB transmitter with improved performance. I actually use a much simplified version of the T2 in conjunction with a sound card in a PC to make an arbitrary modulation data transmitter utilizing the phasing method. (A quardrature, also called I/Q, design can generate or demodulate *any* arbitrary modulation, AM, FM, FSK, PSK, QAM, etc. So it is a very powerful technique.)

>Where can I find a good circuit diagram ?

The Handbooks, either ARRL's or RSGB's handbooks, will have filter method designs suitable for your application, and the latest ARRL Handbook has Campbell's phasing design. There are also some kits available. Campbell's designs are sold by Kanga Kits. Filter method kits are sold by a few of the other QRP project suppliers.

Let me note here that QRP SSB usually isn't very effective on the 75m band. Due to the high atmospheric noise and the heavy QRM on this popular and crowded band, you usually need some power to be effective. I'd suggest that 100 watts be considered the comfortable minimum for SSB operation. You can sometimes use much less, but often you need even more power. So a QRP kit may not be the best way to go.

An interesting approach would be a modern high level phasing rig. This could all be done Class D, and would be very compact and efficient. (That would be very challenging for someone at your level of experience, but perhaps one of our more advanced builders might like to take it on.) Switch mode power FETs could be configured as the balanced mixers/PAs for the high level stage. Suitable devices for 75m are available inexpensively. This would be great for portable use due to the small size and high efficiency possible with Class D operation. Anybody interested?

>below 100 MHz.) is to be driving from a current source of sine
>wave.

I think the answer to that particular problem is to not require
the square waves to go through transformers. I'd suggest using
FETs as the switch elements of the mixer, and drive the gates
directly (in opposing pairs of course).

>Another problem with square wave drive is that if you don't make
>the duty cycle exactly 50%, you degrade the mixer performance.
>It's easier to make a distortionless sine wave (with a low pass
>filter) than a perfect square wave.

That's a problem. Even 2% phase error can cause significant
degradation of performance. At first glance, using a 2x LO
and a flip-flop divider would seem the logical choice, but
most FFs tend to have a degree of timing jitter which makes
this a problem. With a digitally synthesized LO, however,
you can make the symmetry arbitrarily close to perfect by
increasing the number of synthesis steps. You can also use
a walking ring circuit with an even number of stages to
guarantee symmetry to an arbitrary degree.

This latter method also looks attractive as a way to get
quadrature signals over a fairly broad range of frequencies.

>answers.

What a large change! From 166 ohms to 101 ohms! No wonder the suppressor
cures everything from arcing tubes to exploded meters.

Seriously, the problem is Rich doesn't understand the system well enough
to realize the "large" change is diluted and the expected effects reversed
by the rest of the system.

A HIGHER impedance suppressor actually reduces the tendency to of a system
to oscillate much MORE than a lower impedance suppressor. Here's
why....and pay attention to this carefully because it will show how little
Measures understands the very thing he has become a guru of....

Measures claims above:
>of the VHF suppressor in the AL-80. The original suppressor has an Rp of
>about 166 ohms at the anode resonant frequency of160MHz. The replacement
>suppressor has an Rp that is around 101 ohms at 160MHz. Since voltage
gain
>is essentially Mu*Rp, decreasing VHF-Rp decreases VHF voltage gain. //

Here's the path:

tube-----L1-----sup-------L2--------XL------bandswitch
^
Plate tune

The tube is a time varying resistance in shunt with several pF of C (not
exactly the 5 pF of pure C measured in a four foot box with only a
vertical transmission line used in the Eimac data). From the tube to the
suppressor we have series L and shunt distributed C represented as L1
(meaning line 1) . From the suppressor to the tank we have series L and
shunt distributed C trepresented as L2 (or line 2).

From line two we have a fairly low reactance to ground, and then the path branches off to XL (the tank inductor) and the bandswitch.

At different frequencies the total impedance of this path varies widely. At lower frequencies the tank and tube impedances dominate, at higher frequencies the tube (including grid lead impedance), L1, L2, sup, and plate tune dominate.

Here's what we can all clearly see. If the suppressor is a LOW impedance compared to the entire path of the system it will have VERY little effect on Q or circuit loading. It only has a major effect when it's impedance is HIGH compared to the path impedance.

Using logic nearly anyone is capable of understanding, we can solve this problem by going to the extremes of impedance and looking at the system.
As a reminder, Measures claims above:
>of the VHF suppressor in the AL-80. The original suppressor has an Rp of
>about 166 ohms at the anode resonant frequency of160MHz. The replacement
>suppressor has an Rp that is around 101 ohms at 160MHz.

He "thinks" this lowers gain, because he considers it the ONLY element in the circuit. He considers it a direct connection in series with the anode to voltage source, and everthing else in the system is vanished from view!

Take Mr. Measures claim that a lower impedance helps to the extreme, and build a suppressor with the lowest possible parallel equivalent impedance.

That suppressor would be a short circuit. If we replace a conventional suppressor with a direct short the PA will be more stable, according to Mr. Measures logic, "Since voltage gain is essentially Mu*Rp, decreasing VHF-Rp decreases VHF voltage gain."
HE said that, not me. He said what amounts to just shorting the suppressor out will produce the lowest VHF gain and most stability!!!!!!!

Isn't that amazing? The guy who knows so much more than anyone else about suppressors and knows EVERYTHING everyone else does wrong argues clearly (in his own words) the best possible suppression comes from the lowest possible impedance suppressor.

That clearly means a direct short (NO suppressor at all) is the best suppressor, and a pure 1000 ohm resistance in series with the anode would INCREASE VHF gain!!!

Unreal!

Anyone with even the most elementary experience with audio amplifiers knows quite well that a LOW value anode to source resistor INCREASES high frequency response in the amplifier, while a high series resistance LOWERS the high frequency rsponse.

Mr. Measures, on the other hand, argues that his magic nichrome has a lower impedance, and thus LOWERS VHF gain! He clearly argues with less impedance, the PA is more stable. Exactly the opposite of what the most elementary common sense tells us happens!

Which is it Measures? Do we want a lower impedance, like your suppressors offer? Do we want a higher value of impedance like the 80A uses? Will an unstable amplifier be more stable with a zero impedance suppressor, or will adding turns (increasing the inductance and impedance) improve stabilty?

Does anyone out there use the Measures method of removing turns until the PA QUITS oscillating? All my life, I've done the opposite. If you look at the most unstable tubes, they ALL use the higher values of suppressor impedance. Those idiot designers.

Even W4QQ made a big mistake (according to Measures), because he parallel resonanted his suppressor..... guaranteeing maximum impedance at the parasitic frequency. I wonder why that worked, since it disagrees with the Measures theory of stability.

If you look carefully at that big bunny in the battery commercial....you'll see the springs on the drum are nichrome. At least I have an inking they are.

Rich, you demanded I discuss this "Since voltage gain is essentially Mu*Rp, decreasing VHF-Rp decreases VHF voltage gain." thing with you. You were right, we did need to talk about it. I had no idea you didn't understand circuit analysis related to gain. But I really think you need to figure out how the tuning capacitor works first, before you argue gain. Later on, in a year or two, we may be up to the point of discussing gain.

In the mean time, take your hi-fi amplifier and increase the load resistances through all the stages, that will really improve HF response. In the mean time, if you run across a PA that oscillates, lower the suppressors resistance and inductance!!! That will work too. (Seriously to anyone left reading this, don't do that. Such things only work if you live in a pathological science world.)

Rich, it's very clear you have no idea how suppressors work. You just say things.

73 Tom

Did you ever compare these formulas with thos in Snelling's book "Soft Ferrites?" They look somewhat different. Snelling also has sets of measurements on various geometries and permeabilities.

?

Rich, I would rather discuss why you tried to BS me and this newsgroup
regarding the merits of using a peak fault-current limiting resistor
in the anode supply path.

You claimed that Mr. X pooh-poohed the idea. But, isn't it a
fact that Mr. X's concerns on this matter were instead directed
at your claims that a 10-ohm resistor with a 700-volt
rating would be adequate for the purpose?????

Weren't your original claims based on your assumption
that the plate supply had an ESR of zero ohms? Isn't a figure
of 16 ohms closer to reality, Rich? Or, are you
choosing to ignore the added resistance of the plate choke
and meter shunts? The winds are shifting again. Go check your
smoke detector batteries.

Why are you out-and-out misleading us, Rich?

> So why does the 10m bandswitch contact sometimes arc.?

Spiders? Dust balls/cat hairs?? Photons??? Go for it!!

Mr.
> Rauch's measurements, we know that the AL-80's tune capacitor has no
> resonances in that neighborhood.

Yo ho, Rich!!! Hellooooooooo?

Are you adjusting reality to fit your opinions again?
Didn't Mr. Rauch ALSO show that the plate tune
capacitor had such a low value of XL that it would be
impossible to develop the levels of VHF you claim?
Isn't the tune capacitor shunting
the RF path to ground before the bandswitch? Is the gap
across between the rotor/stator plates that much further
apart than the the bandswitch contacts? Take the XL and the
DC resistance of the capacitor, calculate the impedance at
at 160 MHz, and tell me what the voltage drop will be. Don't
go on another tangent about non-existent resonances.
>

> the calculations, Peter, I would appreciate seeing how to do it, and how
to
> calculate what the probable increase in harmonic output would be. I
don't
> have a clue as to how to proceed.

I am sure the harmonic output relating to Q is the most
easily solved portion of the puzzle. Various handbooks show
computer modeled values for Pi and Pi-L networks for a variety
of tube load impedances and the harmonic suppression based
on the selected value of loaded Q.

I am not experienced in the design of RF power amplifiers.
But, I have given some thought to solving the reduction of loaded
Q in a the plate tank circuit based on the HF Q of the suppressor.
There is no simple solution to your question based on what you
presented. But then again, you chose to neglect numerous variables.
The effect of the tube plate lead inductance, the fact that the
tube is a varying resistor in operation, the reactance of the
plate blocking capacitor, interconnecting straps, grid
bypassing scheme -- all these and more would come into
the final equation in one form or another.

> blah, blah, snip >>>Do you accept Mr. Rauch's conclusion?

Rich, this is what I accept. I accept Wes' calculations of your suppressor. I accept both Mr. Rauch's and Ian Smith's observation that a conventional suppressor -- with slight adjustments -- can be made to be as effective at VHF as a suppressor wound with either rusty bailing wire or nichrome.

Rich, do you accept Wes's measurements as being accurate?
Mr. Rauch has stated from day-one that a simple adjustment would permit a conventional suppressor to perform as well as your nichrome wound suppressor. Now that Wes's data is available, others are reaching the same conclusion. Are they all part of a great conspiracy?

> I haven't seen a VHF suppressor design that uses a C. What does this
> circuit look like?

I believe Phil, K5PC, answered this a month or so back when I posed a query regarding the use of RCL components in suppressors. He pointed out that this was done by W4QQ in a 1974 Ham Radio project. I also understand that the "self-proclaimed" amplifier expert has used RCL suppressors in some of his Ameriton designs.
W4QQ was able to reduce what would have been a rather large value of XL by parallel resonating the suppressor to 110 MHz, the resonant frequency of the 4-1000. Tom has used fixed capacitors in series with the suppressor resistor to cancel the XL of that device. (series resonance) This eliminates RF voltage drop across the XL component of the resistor, allowing full dissipation of VHF energy in the resistor. Clear enough? Care to muddy the waters?

1394. Receiver- kit for Weather Sat.'s

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-04 00:00:00 UTC
From: abom@iaehv.nl
Message-ID: <32f7bf9b.12338516@news.iaehv.nl>
Source record: 97662

Hallo, weather satellite- fans

Last year I developed a weather satellite receiver for receiving all
polar satellites. The receiver will be connected to the soundblaster
card in the computer. In combination with a shareware file beautiful
pictures can be received.

Because we had such a good results we intend to publish the complete
electronic design inclusive the print- layout on internet.

Some technical details.

* Manual tuning from 136- 139 MHz.
* Kepler compensated
* Squelched Loudspeaker output.
* Non- squelched soundblaster output.
* Signal strength indication.
* Very Sensitiv for weak signals (0.12 uV/ 12dB sinad)

When you are interested in rebuilding the receiver, please mail us.
At sufficient interest it will be possible for us to order
professional print boards and to supply the special components.
Further it will be possible to give technical support during building
the receiver.
When you are interested in building a low cost and a good performance
weather- receiver let us know.

Best regards,

A.Bom

This doesn't solve the problem of unequal rise and fall
times. The only way I know of to do that is to use two
flip flops operating 180 degrees out of phase driving
the mixer thru a combining transformer. But there you are
back to a transformer passing square waves again.

I remember an article in Elementary Electronics a quarter century ago describing a crystal set for the aircraft band. It was indeed just an LC circuit feeding a diode, a 1N82 if I remember correctly (which I thought was a schottky diode) and an audio amplifer feeding an earphone. The thing was promoted as being legal for use in an airplane, since it was only a diode detector, rather than a superheterodyne or superregnerative receiver, both of which radiate signals that could interfere with the aviation electronics.

They made the point that it was good enough to hear what was going on in the cockpit; the signals were strong enough for you to hear them. I guess that takes care of the selectivity problem that somebody else mentioned; you may hear all the airplane generated signals, but you're aren't going to receive a lot of traffic. As the plane came closer to an airport, you'd hear the transmissions from it. The article also mentioned being able to hear radar signals, which indicates the very wide selectivity of the thing. In fact, I think the lack of selectivity was promoted as an advantage, since you didn't have to worry about tuning it. Sort of like an early aero-band scanner.

Bill Hoisington, K1CLL, in his many articles 73 was always talking about diode receivers as a great means of checking gear for good modulation and weird feedback. He'd go into great detail on making good trf diode receivers for VHF. Look in back issues from about a quarter century ago.

Actually it's rated at 10 volts maximum--i.e., E=(R*P)^0.5 = 100^0.5=10v. However, job at hand is typically discharging a 25microfarad capacitor that is charged up to around 2800v. In round numbers, that's about 100 watt-seconds (a.k.a. joules). In the beginning, we used a cheaper 10 ohm 10w resistor, but they broke down in this application. We switched over to a 2-inch long, glass-coated design that seems to be able to handle the job without breaking down between the turns of resistance-wire. For 3kV or more, we recommend using two of them in series to keep the voltage gradient per turn within the capability the resistors.

> ESR is about 12 ohms as is WITHOUT any resistor.

The article says: "During a major glitch, the anode (plate) current meter is subjected to a current surge as the HV filter capacitors discharge. Such a current is several hundred peak amperes. Several thousand volts divided by 'zero ohms' is not several hundred amperes. Try dividing several thousand volts divided by 10 ohms and see what you get, Mr. Rauch.

The added10 ohm glitch resistor came later.

12 ohms seems pretty high. There must be lots of ESR in the AL-1200's filter capacitors. With 0.7a of ripple current, you could be dissipating plenty of heat in the electrolytic filter capacitors. Which capacitor manufacturer made them?

> Adding a ten ohm resistor would lower fault current from 291 amperes to
> 159 amperes IF the resistor did not arc internally. Big deal.

It is a big deal to us because we use 200a-maximum glitch protection diodes.

> Adding a correct style 35 ohm resistor would lower fault current to 75
> amperes. That's a good improvement.

True enough. But how low do we need to go? Svetlana recommends 10 ohms to 25 ohms for a 1500w tube. Would anybody like to guess whether or not Ameritron/MFJ amplifiers use a 'correct style' resistor?

> Adding the wrong type of 10 ohm resistor is a waste of time, unless the PA

Hold on there counselor. You are putting words in my mouth. I did not state
that suppressors do not operate in a parallel mode and that Rp is not
significant. Clearly, the way a suppressor is configured, it is a parallel
network. Equally clear is that it operates in series with the remainder of
the circuitry.

Every parallel network has an equivalent series one (an vice versa), which
when measured independently is indistinguishable from the other. This does
not mean that the equivalent networks behave the same when imbedded in another
network.

I offered to make the measurements as an unbiased third party. This is what I
do for a living. This does not mean that I don't have an opinion, just that I
try to keep my opinions from coloring my judgement; again part of my job.

I published the data for everyone to use in making his own judgement. Frankly,
I'm not personally convinced that extrapolating some isolated laboratory
measurements into a definitive statement about the relative "goodness" of a
particular circuit is good science. Sounds more like lawyerin' to me:)

Just to clarify my posting, I was referring to double balanced
diode mixers where the LO is injected thru a transformer. For
FET mixers or Gilbert multipliers, I agree that square wave drive
is better, IF YOU MAINTAIN 50% DUTY CYCLE.

:>to masquerade as VHF on a spectrum analyzer.
:>

I don't know of many commercial amplifiers, particularly amplifiers by
manufacturers you have so regularly libeled, that would allow observing
the color of of any arc while operating.

An arc contains all manner of harmonics. Since you claim to have
measured
high-Q VHF resonances in the plate circuits of many commercial amlifiers
it is entirely possible that a high-Q resonance would allow the
radiation
of sufficient VHF energy to be detected on a particular TV channel or
peg
a sensitive VHF field strenght meter.

The only reported and documented observation by spectrum analyzer is
that
by Marvin Born on a nototiously unstable Create 3CX3000 amplifier ... an
amplifier that *YOU* have insisted on claiming (many times) was an
Ameritron AL-1500.

:>
:>You did not explain why a load fault was not subsequently discovered in
:>the antennas or feedlines. Why did the mysterious arcing cease after
:>the VHF-Rp of the VHF parasitic-oscillation suppressors was decreased?
:>

The problem need not be confined to the antennas and/or feedline. It
could also have been an antenna switch, the T/R relay, a coax cable, or
a lightning arrestor (or are you going to hide that story again?).

:>
:> Are X-rays and Gamma-rays charged particles, Joe?
:>

Not a subject of this discussion ... AT&T claim the solar event was not
the cause of the failure.

:>
:>Are you saying that geosynchronous satellites do not travel in and out
:>of Earth's shadow, Joe?
:>

Of course they do ... however, if this had been caused by a solar event
it would nost sretainly have also damaged other TV satellites of the
same
or similar design within a few degrees of T401. However, since all of
this flies in the face of your pseudo-science you will ignore it or
distort it as usual.

Hi Cecil,

I noted your posting above last summer and was struck by how we have
similar intersets in this regard. I've built several of these, but in a
Coax implementation. I did this for the economy of size. I even chose the

same increments and length (1' X 32') but to suit a requirement of being within 1/8 wl of transforming an impedance to anywhere on a smith chart for frequencies above 7 MHz (if I recall, its been some years).

Mine have worked fine in rotating vectors (per Walt Maxwell's "Reflections") for presentation to my GenRad RF Bridge. I call my design my Binary Variable Transmission line (or BVT).

I would appreciate discussing this at length, public or private, so that I might resolve some puzzling aspects. I have a hunch you could help.

>it was pointed out that it is advantageous to drive mixer circuits
>(maybe a particular class of mixer circuits, e.g. diode ring)
>using a square wave LO rather than a sine wave.

Good question. There seems to be a lot of literature concerning using mixers, except on this topic.

Here is my 2 cents and I hope others contribute additional input. thoughts.

1. In a doubly balanced diode ring mixer (diode quad) the IF port receives the RF signal with opposite polarity (i.e. 180 degree phase shift). When the switching action is square, the resulting IF spectrum consists only of the sum and difference of the RF and LO frequencies (RF and LO being suppressed in the IF output).

2. When one pair of diodes is forward current biased, the other pair is reverse voltage biased by the voltage drop of the forward pair. If the RF signal becomes comparable to the LO injection power, the switching times are a function of the RF as well as the LO signal level. These leads to signal compression and IMD. Using square wave vs sine wave injection minimizes the diode transition times, making the switching more independent of LO level.

3. Using digital dividers to generate the LO, can offer the following additional advantages.

Easily provides wide band LO in phase and quadrature (single signal DC receivers, additional side band suppression from product detector stages). For example, a twisted ring counter (2 D flip flops) divides the input frequency by 4 while providing the required 90 degree phase difference. Advanced CMOS (AC) logic works into the VHF reqion. However, the initial signal needs to be 4X the LO frequency. This can be used to advantage since any free running oscillator drift will be divided by 4 as well (synthesizer step size as well).

The addition of a digital divider to most sine wave oscillators can reduce phase noise as well .

Rick Karlquist wrote asking for a square-wave mixer driver success story.
& Ed Pacyna provided a very interesting account of the theory behind such
mixers.
The story Rick wanted (with a very happy ending) may be found in QST for
February of 1993 in the article "A High-Dynamic-Range MF/HF Receiver
Front End." J. Makhinson uses square waves to switch FET switching
mixers and obtains a third order intercept of up to +43dBm. Previously
the same author presented this circuitry in Communications Quarterly for
November 1990. There was a QST follow-up by another author several
months (perhaps exactly a year) after the 1993 article which showed how
to get an even better intercept figure by using higher-voltage square
waves to switch the mixers. Also, I recall a correction on transformer
phasing somewhere in between those issues.
A few years ago SPRAT had an article on using logic switches as mixers
and Electronics Design recently had such a circuit, but I am not sure if
the driving LO signals were square waves.

Apparently you are unfamiliar with the definition of the word 'libel'---and you have never looked into the top of a Heath SB-220 amplifier.

...snip...
> :>You did not explain why a load fault was not subsequently discovered in
> :>the antennas or feedlines.

Sorry for the inadvertent omission, Mr. Subich. No load fault was subsequently discovered in the antennas or feedlines because there was no load fault in the antennas or feedlines.
In other words, the arcing that destroyed the original bandswitch and the replacement bandswitch in Rick May's AL-80 can not be explained by a load fault. The only thing that was altered after bandswitch #3 was the VHF-Rp of the VHF suppressor in the AL-80. The original suppressor has an Rp of about 166 ohms at the anode resonant frequency of160MHz. The replacement suppressor has an Rp that is around 101 ohms at 160MHz. Since voltage gain is essentially Mu*Rp, decreasing VHF-Rp decreases VHF voltage gain. //
The e-mail address of Rick May is listed on my Web page if you need more answers.

>Why did the mysterious arcing cease after

If this had been the case, then why didn't a problem show up when the Drake L4B was connected to the same load? If there was a problem with the things you listed, then why was there no apparent problem when the AL-80 was placed back in service with its new VHF suppressor?

1414. Help wanted: FT901D not WARC. Any experiences about adding 30 meters tx/rx to it.

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-04 00:00:00 UTC
From: andrew@phicom.dungeon.com
Message-ID: <32f7340f.0@news.flexnet.net>
Source record: 97839

I have an FT901D without the WARC bands. I am hoping soon to take (and pass) my 5 wpm morse test for the UK Novice A licence. This gives gives me access to some of the 30 meter band.

My 901 has a 12 way band switch, ten bands are marked 160-10 (10 in four segments) + WWV/JJY (rx only ?) on 15 MHz. The XTAL unit has provision for 11 xtals, the last socket is not populated on mine.

I've calculated the required XTAL for heterodyne to lock up the VCO etc. and think I could get this going. Does anyone know if the rest of the rig will support this - i.e taps on PA coil, preselection, band trimmers etc.

The MHZ part of the display seems to be programmed rather than derived from the frequency. One of the 'unused' positions actually brings up 27MHz - a hang over from the FT101s with eleven meters perhaps ?
I might have to re-engineer this with some logic.

I don't mind sacrificing 15 megs, but ideally would put 10 megs on one of the unmarked positions.

I know I could buy a WARC 901 - or another rig, but I thought I'd try to sort the one I own - in the spirit of amateur radio !

Any suggestions or experiences would be helpfull - thanks for getting this far !

If this simply isn't feasible I'll give up gracefully now !

I didn't get it right away. A digital spred must be one of the 900
mhz portables used in homes and costing a good deal more than
46-49 mhz equipment. The radio station analogy is the correct one.
What does it matter what kind of security you have on YOUR phone (900
mhz),
when you are talking to one (46-49 mhz) that is on the air and
accessible with
a simple police scanner. I am waiting for the day, when someone
hooks a board, two simple CD players, and a microphone to his portable
and begins doing a radio show for the neighborhood. I have a friend
who calls me on his portable from Sacramento, while I am on a home
portable. We very often do a show that woud make any dj in the six to
ten a.m. slot sit up and take notice!

This is a real-time analog spectrum analyzer which covers 100kHz to 1200mHz with a variable persistence CRT. The RF section is a 8554L and the IF section is a 8552A. This is a piece of quality HP equipment which sold new for over $12,000. It is in working condition and the manuals are included. I'll start the bidding at $250 plus Mail Box Center packing and shipping charges. Bidders from the 48 states only please. Offers will be accepted until next Friday 2/14. The unit is in no.VA (ZIP 20170) and the shipping weight is about 75lbs. Please forward all questions and offers to my home at: radiodale@dclink.com

Thank you,
Dale

Apparently, being a member of Fifth Estate will do little to improve one's legal acumen.

According to American Heritage Dictionary: "name-drop"
To mention casually the names of illustrious or famous people in order to imply that one is on familiar terms with them, intended as a means of self-promotion.

I published a photograph of a burned bandswitch that was removed from an ETO amplifier. Are you suggesting that---like the "fake" photo of the Bruno Magli shoes---this photo was also fake? Would you like to speculate on whether or not this bandswitch would be introduced as evidence in the event that Mr. Erhorn sued me for libel?
Regarding the formula on page 13.13 in the *Radio Amateur's Handbook*, do you believe that the maximum RF current in an 8877 amplifier's DC blocking capacitor is 46 amperes rms when the tube is operating at 4kV and 1a?

>
I must confess that I did not fly to Colorado and check these things for myself, Mr. Subich. I'm not 'absolutely certain' that Rick May even exists

because I have never met him face to face. Hmmmmm. Are you absolutely certain that Rich Measures is writing this, Joe? If Rick May said that nothing else was changed, this was probably the case---even though he is married to my sister.....not. Rick's experience with an AL-80 is not unique. Sure AL-80s don't eat as many bandswitches as TL-922s, but they do eat them on occasion.
During my 1990 phone conversation with Mr. Rauch, he insisted that AL-80 bandswitch failures were attributed to bad operators, and/or cheap coax, and/or bad antennas. I don't think so.
Mr. Rauch told us that Mr. Miklos was an "R+D engineering manager". Eimac's personnel department says otherwise. Mr. Rauch said that Mr. Miklos would appear on this Newsgroup in January.

> parallel mode (Rp is not significant) ...snip...

I believe that everything in the VHF-resonant anode circuit's signal path makes some degree of difference, but some things more than others.. Except within the city limits of Conyers, GA, U.S.A., roughly half of the VHF current flows through Rs and half of the VHF current flows through Ls. IMO, that is not something that should be dismissed out of hand, even by a self-recognized amplifier expert. Those who say that the suppressor does not count probably should not be using a suppressor.in the first place. The next time you talk to an AL-1500 owner, ask him/her if an 8877 failed during the 12 month warranty period. To the best of my knowledge, the AL-1500 is the only 8877 amplifier that does not use a VHF parasitic-oscillation suppressor.

> Perhaps you can explain why adding a 250 Ohm resistor in parallel
> with a conventional supressor would eliminate VHF parasitics?
>
100 ohms in parallel with 250 ohms = 71 ohms. Decreasing Rs from 100 ohms to 71 ohms reduces the parallel-equivalent resistance (Rp) at VHF. Why not try using a 1 ohm Rs and see how the parallel-equivalent calculation for Rp comes out at 100MHz, Joe? Post the results, and we'll all have a look.

For a refresher course in parallel-equivalency, you might try the
VHF-suppressor article in the March, 1989 issue of QST magazine.

In our low VHF Q parasitic-oscillation suppressor for 3-500Zs, we use two
Matsushita 100 ohm MOF resistors in parallel, so Rs is 50 ohms, not 100
ohms. The low VHF Q suppressor that Wes, N7WS, measured had one Matsushita
100 ohm MOF resistor. Presumably Wes, used 100 ohms instead of 50 ohms to
preclude a stenorian cries of FOUL from the Rauchian encampment.
Using the same value of Rp, 100 ohms, at 100MHz, Mr. Rauch's suppressor
produced over 60% more Rp than did the Ni-Cr-Fe alloy suppressor. Since
VHF voltage amplification is basically Ae=Rp*Mu, the question is: does one
want more VHF Ae or less VHF Ae in one's amplifier?

Does it make sense to use silver or copper conductors in the design of an
electrical circuit that supposed to dampen regeneration?

>This latter method also looks attractive as a way to get
>quadrature signals over a fairly broad range of frequencies.

I built a 75M SSB transceiver using the Campbell R2/T2 circuits. The LO was a free running 15 - 16MHz oscillator. I used a Johnson divider (also know as a twisted ring or walking ring circuit) to generate the I and Q signals. The advantages of this approach were:

The 15 - 16Mhz was divided by 4 to get 3.75 - 4.0Mhz. The final LO drift (long, short, 10 degree C heat rise) was never more than 20Hz. The oscillator was designed for low drift characteristics (used FET current limiting, air wound inductors etc.).

Since the oscillator not run at the same operating frequency of Rx and Tx, many of the problems with direct conversion (DC) rigs were not problematic.

This approach generated the necessary Rx / Tx wide band I and Q signals (nice for multi band and large QSY excursions) without requiring power splitters. The side band suppression was excellent (barely audible on a S9+ + + signal).

Hi Scott,

I spent 10 years in the Submarine Service (USS Barb SSN-596) and regret to tell you that almost all sub communications are encrypted. The only open communications you could hope to hear would be between an arriving or departing sub and its associated tug boats on the standard marine freqs, namely 156.650 or 156.800 Mhz.

Also, 98% of the encrypted sub comms take place on VHF/UHF via satellite. Claims made by manufacturers of VLF receivers claiming to be able to receive submarines are just hype. Don't let this deter you from pursuing a hobby in radio though - there's plenty of other exciting stuff out there. Oh, there is one way you could monitor sub comms - join the Navy and volunteer for sub duty! It really is (was) an adventure!

>For analysis at other than a single frequency, you have to use the correct
>network, not an "equivalent", or else find and use a different "equivalent"
>at each frequency.

True. I should have so stated. It gets dangerous when one mixes
constant reactance values with actual component values. If fixed reactance
values are used for all calculations, then the frequency doesn't matter. When
we use real component values, the frequency certainly makes a difference.

>The equivalent networks DO behave the same when embedded in another network
>-- but again, only at a single frequency.

Correct again. This is where I went back to real components.

I've got to stop writing this stuff after midnight. As you first noted, this
is a real tar baby.

There really is no LEGAL way to jam their equipment. The only thing
that you could hope to do is cause severe RFI but then it would mean
that your equipment is not operating within accepted parameters.
Your best bet is to TALK to your neighbors. Be neighborly! It sure
can avoid problems.

I am not the person who dismissed the solution to the 100 ohm Rs, 85nH Ls,
F=160MHz problem. I calculated the answers according to standard AC
Circuit-Analysis. These answers were summarily rejected by Mr. Rauch, who
apparently solves such problems by intuition.

Look into a VLF converter. There have been several in the last 15 years or so in the hobby magazines, or some of the equipment companies make or made them (Palomar, MFJ, Heathkit used to). These shift the 0-500 kHz range of frequencies up to (usually) 3.5-4 Mhz.

One suggestion is to read the series on VLF in Radio-Electronics magazine in 1983 by Burhans. Several article during that year on VLF loops, longwire tuners, and a converter.

There are a couple of signals I've read of or heard that the US Navy uses. One is the system in Michigan and Wisconsin that operates in the 60-70 Hz range, and is .0625 baud phase shift keyed. 16 seconds per bit, at least that's what I remember from an article in Popular Science. That's the one they use to get to the submarines under the surface.

There's another system that they run (or ran, I'm not sure if it's still going) that runs in the 25 kHz range. The signal is MSK (minimal shift keying) FSK in the low (50?) baud range and is encrypted beyond any ability that an amateur could come up with. One example of a transmitter site is Jim Creek, Washington, in the mountains northeast of Seattle. The antenna is a toploaded vertical over a thousand feet long, with the support structure being the mountains on either side of the valley the transmitter site is in. The various SWL hobby lists give the transmitter power as 300 kilowatts at 24.8 kHz. There's a similar site in Maine.

Rich

The suppressor is at best a compromise between VHF and HF performance.
The designer must keep the inductance at a minimum, otherwise the
designed loaded Q of the HF tank will be compromised. The higher
the plate resonance, the smaller the inductor maybe made and still be
effective at VHF. Most modern tubes have resonances in the area of
160 or 180 MHz I believe. But, the 4-1000 has
a plate resonance at 110-MHz. Rather than using a large value of L in
the suppressor (and comprising 10 meters) the designer opted to use
a rather small value of L and parallel resonanted the suppressor
LC components at 110 MHz.

At 110-MHz, where Xc and Xl cancel, only the suppressor resistor
is in the path for VHF energy. The coil and capacitor are resonant, and
present a very high impedance path for VHF. An ideal situation. Look at
the
series circuit equivalent, with L, C, and R in series. L and C
reactances cancel, the impedance is determined by the value of
R.

Would you rather use a clever scheme like this in a 4-1000 design,
or would you opt for a suppressor made with nichrome windings,
and compromise the ten-meter tank Q?

Rich, why do you ask us to accept your claims at face value,
despite the fact that Wes's measurements show that nichrome
suppressors offer negliable improvement over conventional designs --
while
on the other hand where those measurements allow others to
show that they compromise tank Q on ten-meters, we should assume
those facts to be of no consequence?

You have admitted in this forum that until Wes undertook some
basic and fundamental measurements of your suppressors you had
no idea how they actually performed -- despite having marketed them
for the past 13 years..

You have admitted that you do not own a Q-meter, RX meter, Network
analyzer or spectrum analyzer. But, through good engineering and science
(and a crystal ball or two??) you have all the answers using a dipmeter
and by watching pretty arcs. Observations based on random occurences,
in uncontrolled environments combined with an infinate number of variables
was not acceptable science when I went to school. But, perhaps the
sciences are more liberal these days..

You have also admitted that you have no idea how to calculate
the effect of suppressors on the loaded Q of a HF tank coil. Where
is your credibility? What happened to good engineering and science?

When an industry recognized, practicing engineer questions
your findings, or posts his views, why is he
misquoted, subjected to obscurantism,
and vilified? I have been following this thread in the hopes of
learning and honing my own limited skills. I tried to keep an open
mind, being careful not to involve personalities or questioning
financial motives. I don't have all of the answers, but as the smoke
slowly clears I think I can pretty well determined who does.

measures@mail.vcnet.com (R. L. Measures) writes:
:>
:>Apparently you are unfamiliar with the definition of the word
:>'libel'

As a member of the Fifth Estate, I am most certainly familiar with the concept of libel and can assure you that publication (including posting on the internet) of charges such as you make may very well be considered libel. I'm suprised that Messers Erhorn, Henry, Collins, et al. haven't considered legal action. Since none of them are "public figures" in the legal sense, they do not have the burden of proving malice ...

Much of what you have claimed has been proven false by third parties. You post as fact information you know to be untrue (Marvin Born's alleged AL-1500). You asssign impure motives to anyone who dares to disagree with you. And you ridicule anyone who shows the errors in your pseudo-science.

:>---and you have never looked into the top of a Heath SB-220
:>amplifier.

Yes. Since it consists of a double case for shielding, has a fairly bright set of tube filaments (though certainly not bright enough to read the newspaper), and has a fairly pronounced redish-orange glow from the plates at normal power output ... no person of normal vision and color perception is going to be able to tell with any certainty the difference between a blue and pruple arc -- particularly an unexpected and transient arc.

:> The only thing that was altered after bandswitch #3 was the VHF-Rp
:>of the VHF suppressor in the AL-80.

Are you absolutely certain that every other portion of the system was unchanged? Are you certain that a different jumper cable or antenna switch was not used? Are you certain that rewiring the anode circuit didn't result in some minor (but significant) change to a TR relay?

:>The original suppressor has an Rp of about 166 ohms at the anode
:>resonant frequency of160MHz. The replacement suppressor has an
:>Rp that is around 101 ohms at 160MHz. Since voltage gain is
:>essentially Mu*Rp, decreasing VHF-Rp decreases VHF voltage gain.

SO WHAT! Even Wes Stewart, who made the measurements you are so fond of quoting now states that the supressors do not operate in the parallel mode (Rp is not significant) but rather operate as a SERIES

component in a COMPLEX network which includes the tube output capacitance, the stray capacitance from the plate blocker to ground, the parasitic inductance in the plate blocker, stray reactances in the plate choke, etc.

N7WS further states on his web page:

"Some mathematical manipulation can demonstrate that shunting the conventional suppressor with additional resistance will bring the curves into better alignment. An additional 250 ohm resistor in parallel with the network will cause the Rp curves to nearly overlap the nichrome curves above about 30 MHz. Below 30 MHz, the Rp of the adjusted conventional type will be higher than the Rp of the nichrome device."

Perhaps you can explain why adding a 250 Ohm resistor in parallel with a conventional supressor would eliminate VHF parasitics?

>also
>>110MHz?

Yes, it has been a well established fact for the 4-1000A...

Did the author explain the purpose of the 20pF capacitor?

No, he didn't, but it is to resonate the coil and resistors @ 110 mhz

How much DC anode voltage do you use? Does this amplifier/suppressor perform
>>satisfactorily on 10m?
>>
>> I use 6000 volts on the anode. It was the first suppressor that I found to
be successful on 10m in the late 70's @ 1500 watts without using a big
Glowbar resistor as R in a suppressor.

Some logic families are notorious for having quite different current sourcing and sinking capability. When driving large capacitive loads, this will result in different rise and fall times. Flip-flops are problematic in many ways. Some have internally feedbacks taken directly from the output pins, reducing the fan-out capability. A heavy capacitive load at the output could even cause erratic operations due to the internal feedbacks. As a general rule, never use a flip-flop as a line driver (or mixer driver) directly.

A +7 dBm mixer (5 mW) requires 0.5 V and 10 mA rms driving power and some logic families have problems supplying 10 - 15 mA.

A buffer with low input capacitance and symmetrical output impedance would reduce the timing jitter problem.

ECL flip-flops and buffers are designed for the transmission line environment and have other desirable characteristics (non saturating outputs, low output voltage swing, high current output). ECL works at low frequencies, even if it would be strange to find ECL chips in a 1

MHz environment :-)

In a stack of eight capacitors, that's an ESR of 1.5R each - for
300-400V units that looks pretty normal.

>> Adding a ten ohm resistor would lower fault current from 291 amperes to
>> 159 amperes IF the resistor did not arc internally. Big deal.
>
>It is a big deal to us because we use 200a-maximum glitch protection diodes.
>

Are you seriously recommending diodes with a surge rating of only 200A
to handle a surge of up to 159A? Those diodes are safety-critical
components - not just equipment safety but human safety too. For the
little extra cost of fitting a higher-rated component, I would never
trust a surge rating where safety is involved.

As a basic safety precaution I would limit the maximum possible surge
current to a much lower value (such as 40A - see below) and choose the
protection diodes on the basis of their CONTINUOUS current rating. Then
I can be sure that those safety diodes will hang in there until a fuse
or breaker blows.

>> Adding a correct style 35 ohm resistor would lower fault current to 75
>> amperes. That's a good improvement.
>
>True enough. But how low do we need to go? Svetlana recommends 10 ohms to
>25 ohms for a 1500w tube.

Eimac recommends 50R for a 2kV supply, so that even the surge current
cannot possibly exceed 40A. I'll go with Eimac.

When it comes to safety with HV supplies, there's no such thing as
overkill.

I have a C50 question. According ot the boot load section of the
databook, it says that their are several methods of loading an external
program in to internal memory, however if you look at the schematic
for the cheap-O kit, the bus is not set for the 8-bit parallel load
at FFFF (uses *BR,*DS at reset).

Is it possible that the 27C256 has the appropriate bits set?

Doug

I hate to put a damper on your interest, but I believe that you'll find it very difficult to monitor the US Navy submarine transmissions at VLF ... those transmissions are HEAVILY coded, both for security and for error correction to allow reception under the worst of conditions ... I doubt that you'll have much success in making heads or tails of any bits that are flying about in that part of the spectrum.

This is NOT to discourage your interest in radio, but simply to caution you to set realistic expectations about whay you may or may not be able to receive before you embark on a project that may involve considerable effort. There are a lot of interesting things to listen to at VLF ... you might check out the "Lowfer's Page" and other links you'll find there ...

1449. AADE L/C Meter II-B

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-05 00:00:00 UTC
From: rmote@rain.org
Message-ID: <5dah21$do8$1@news.rain.org>
Source record: 97688

Just got my L/C Meter II-B from Almost All Digital Electronics yesterday, and it went together quite nicely. Finally -- a meter that updates fast enough to follow a variable cap or roller inductor that's being turned! And approximately 1% (of *reading*, not full scale!) accuracy ain't bad either, for an $89 kit. Neighbor KC6BLI had one, and after seeing it work I just *had* to have one for myself. It won't replace the old B&K LCR meter for large chokes and electrolytics, but it'll run rings around the B&K when measuring RF components. Neil Heckt has done an outstanding job on this little kit, and I understand he's working on more (like a nifty little microwattmeter).

On the downside, he uses a clear plastic sheet with adhesive backing as the front panel label and dial "window". 'BLI and I both cut off the top portion over the display opening and replaced it with microscope slides held in place with jewelers' cement -- works FB. Enlarging the hole in the case also improved readability of the display at the more extreme angles, but is hard to do neatly (i.e., straight, smooth edges). Didn't bother me much, as I was more interested in functionality.

Although the display will read .01 pF to 1 uF, the real bottom end for decent accuracy is more like a couple pF. Not a real problem, as most garden-variety components only go down to a couple pF anyway. All in all, a very nice little unit, at a darned good price for what it does.

If you're interested, contact Neil at <neil@aade.com> or:
Almost All Digital Electronics

>much less, but often you need even more power. So a QRP kit may
>not be the best way to go.

I would disagree. Last winter I build a 75M SSB QRP transceiver. It used the filter method for sideband suppression and was built on a PCB 4" x 6". The output was 10W PEP. Over a 4 month period I worked 55 countries using a 102' inverted V, 45' at the apex, fed with ladder line. On several occasions, I disconnected the final and maintained contact with the driver (250mW). I spent no more than 4 or 5 hours per week, between 5PM and 10PM EST working DX on this band.

The difference between 100W and 10W is only 10dB. On state side QSO's folks didn't seem to care much if I was S9 +10dB (and not S9 +20dB).

Can you explane how 3KHz+ voice bandwidth is available at the output even when

it passes through a 1.8KHz LP filter after the fisrt Qmodulation? I've been trying to understand it for some time but crunching long equations is no fun.

Can you give a comparision of performance of Tx/Rx made in the three mthods? Also, maybe you could help me build my rig I'm planning for the 20M band.

As written, this could cause people to reach wrong conclusions.

Every parallel network has an equivalent one (and vice versa) which is indistinguishable ONLY AT A SINGLE FREQUENCY. This qualification is very important. If you have, for example, a parallel network, you get a different series equivalent circuit at each frequency. So you can't just replace one with the other, then do your analysis at a different frequency. For analysis at other than a single frequency, you have to use the correct network, not an "equivalent", or else find and use a different "equivalent" at each frequency.

The equivalent networks DO behave the same when embedded in another network -- but again, only at a single frequency.

Source record: 97607

Hi there. In response to your question on how to identify the inductor you have you could simply place a large capacitor with a known value across it (solder of clips will do). The capacitor could be a ceramic non polarized 100pf type. Then place a Signal Generator across the parallel circuit you have formed with the L and C. Across this place a CRO. Keep the earth leads common at one end of the parallel LC. The CRO has little loading or detuning effect on the tuned circuit. Observe the waveform on the CRO and when the frequency you are applying matches the resonant frequency of the LC circuit there will be a noticable increase in amplitude of the waveform on the CRO.

Pick a starting point of 1 MHz but be prepared to go lower and higher. There will be one frequency where the amplitude is maximum.

As you know the capacitor value (100pf) and you can calculate XC (capacitive reactance) XC = 1 0VER 2 PIE F you now know that XL = XC at resonance. Transpose XL back to L and there you have it.

Sounds difficult? it's not.

That's the best way I can think of.

cheers

I've looked all through my books. I can't find that either. My spark plug wires arc blue, as does my 160 meter mobile antenna coil. Maybe my IC-706 or MSD car ignition are putting out UHF parasitics?

Or maybe this is just something someone just said, without having facts. Was the person that started this color thing a reliable source noted for accuracy?

Hmmm. Maybe they would get the hint? Either that or they would firebomb
your home.

Perhaps they need to be tested as dummy loads for a 25 kW 2.45 GHz amp?

Actually, I have (accidently, really) found that 100 Watts on 450 MHz quite
nicely
disrupts most consumer electronics within about 40 feet. Including the VCR
taping
my wife's soaps...

>
> Yes, it has been a well established fact for the 4-1000A...
>
> Did the author explain the purpose of the 20pF capacitor?

The anode-resonance is somewhat dependant on the amount of external L that is connected to the anode. Since the anode-C is around 9pF for a 4-1000A/8166, 220nH would create a resonance at 110MHz.

> No, he didn't, but it is to resonate the coil and resistors @ 110 mhz
>
True enough if Ls is 110nH. However, a 110nH Ls is going to produce a substantial voltage drop at 29MHz due the anode-C of 9pF---which, at 29MHz, has about 600 ohms of reactance. At 6kVDC, the AC anode voltage would be a bit over 3600Vrms. Thus, the current through Ls/Rs would be about 6Arms at 29MHz. IMO, this would dictate that Rs be rather robust, lest it combust.

>

Thanks.
It's an interesting idea, Phil. I wonder why none of the amplifier

manufacturers are using the technique---especially Ameritron since Mr. Rauch gave W4QQ high marks. On the other hand, I see that W4QQ is not on Mr. Rauch's recognized (and self-recognized) Amplifier Experts List in the 9/94 issue of QST magazine.

1463. Top 10 Mistakes with a Digital Scope

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-06 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0602970617320001@wd1v.mv.com>
Source record: 97616

If you are getting ready to use a digital storage oscilloscope (DSO), you should consider the most common mistakes made trying to use them.

The Top 10 Most Common Mistakes Using a DSO

* Believing you don't have the time to learn how to master your DSO.

* Starting a session after someone else has used the DSO and not first doing a default reset or going to a known front panel status.

* Undersampling the waveform as a wider time is attempted to be viewed with too short of memory DSO.

* Looking at too small an area of time so the view seldom includes the views of causes AND effects.

* Not getting and reading all of the DSO application notes that address your project.

* Squeezing 4 traces on a single grid and using the volts/div. control to bring each waveform to a little less than 25% of full scale and thus throwing away 2 orders of magnitude of resolution and accuracy.

* Taking only 1 measurement and believing "the truth is known" instead of using persistence, histograms, statistics, etc. to let the scope show what is changing over time. Similar to NOT using FFTs to see what is changing in the frequency spectrum.

* Using a passive probe and trying to measure a high frequency and/or load sensitive circuit.

* Not using the scope's built-in measurements and using cursors or counting grid squares for every measurement.

* Not speaking with others in your company or team that use your model DSO and getting their techniques, front panel set-ups, remote control software ideas, etc. An informal users group can be an incredible asset and save you a lot of time.

I was hoping Mr. Miklos would show up, as proffered by Mr. Rauch, but January came and went along with my hopes. Based on the information I received from the Eimac/Salt Lake personnel department, Mr. Rauch, either knowingly or unknowingly, made misrepresentations about Mr. Miklos' job title and area of responsibility when Miklos was employed by Eimac. I should think that Mr. Miklos would be eager to appear and set the record about his CV straight. Perhaps he doesn't want to embarrass his friend, Mr. Rauch.

RE: Miklos' dissecting and analyzing dead tubes: Mr. Rauch has repeatedly said that analyzing dead tubes is absolutely, positively, 100% impossible.

cheers

The figures are not mine. The figures are from Wes' measurements, from
Eimac's specs for the 3-500Z, and from worldwide-accepted (except in
Conyers, Georgia, U.S.A.) AC Circuit-Analysis calculations.
Since no one seems to be able to calculate how Wes' measured value of ESR
(4.32 ohms) for Ls/Rs would affect the harmonic output of a 30MHz signal,
and no one has apparently measured the harmonic output of an amplifier that
uses a Ni-Cr-Fe alloy VHF suppressor, how are we to know if the sky is
really falling, Peter?

Source record: 97623

I'm a new ham, and trying to learn more about electronics. I just finished building the 13.8v 5A power supply detailed in the ARRL handbook. Learned a lot, but I need some help. I had wanted to use the above for powering a mobile rig indoors, but failed to look before I leaped- it requires at least 10 A's! So I guess I will try to modify this one, or build another. I want to look at using a couple of pass transistors with this one to see if I could make that work (with an obviously bigger transformer! I'm looking for a 18-25v 20Amp transformer if anyone has one for sale...).

Anyway, I would like to see if someone would be willing to correspond with me offlist for detailed discussions and perhaps passing schematics back and forth. If interested, please email at the address below. Thanks,

The best way to handel that is take your huge speakers with the 13 inch CV's in them and turn them around facing the wall that they live behind (provided it's an apartment) and set your timer for one hour after you leave, crank up that bad boy, get some really offensive rap CD from Death Row and set it to go off just before you get home from work and that should take care of that! :)

1472. HP1817A

Hi all!
I'm lookin for information on HP1817A RF sampler. I got a surplus unit
on it's c. case, but no more info at all, even at HP homepage.
Any Idea?

Best regards:

Marcus Ramos(PY3CRX)

>
> 73, Bill W7TI
> wrt@eskimo.com

Gold has low emissivity. Thus, when the grid heats up from the flow of normal grid current, primary electron-emission from the grid is minimal. Also, gold conveniently has a high boiling point---and, as an added bonus, gold helps to reduce the ESR of the grid. ESR becomes progressively more important as the frequency increases. The 8877's anode-to-grid C is 10pF. At 250MHz, 10pF has a reactance of 65 ohms. When operated from a 4000v anode supply, an 8877 has about 2700Vrms at the anode. Thus, I-grid (rms-ac)=2700V/65 ohms = 41.5A-rms, or about 0.43A-rms for each of the 96 grid wires. Due to skin-effect, 0.43A-rms @ 250MHz is a considerable amount of current for a wire whose circumferance is only about 1.1mm. Thus, if the 8877's grid wires were not gold-plated, serious grid heating would probably result at such frequencies.

RE: Gold-evaporation: In the last batch of kaput 8877s I received from Lon Cottingham, K5JV, two of the three 8877s contained condensed gold particles/'melt-balls'.
However, I do not believe that gold-evaporation is likely in HF amplifiers if the VHF-Rp (parallel-equivalent R) of the VHF-resonant anode circuit is made as low as is practicable. To explain: since voltage amplification (Ae) is basically Mu*Rp, if the VHF-Rp is relatively low, VHF-Ae is also relatively low---which should reduce the likelyhood of VHF-regeneration. However, none of the foregoing applies in one area of the State of Georgia.

Placing the tune capacitor close to the anode in order to increase the anode resonant frequency also contributes to VHF stability. Fortunately, this applies throughout Georgia.

For more information, try Dick Erhorn's Chapter 13 in the 1995--1997 Editions of the *Radio Amateur's Handbook*. If you don't have a copy yet, the soft-cover version is available from the ARRL for $44, inc. UPS. ground-delivery

1474. HF diode receivers (was VHF crystal diode receivers)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-06 00:00:00 UTC
From: edbu@sepia.wv.tek.com
Message-ID: <5dd38fINN2k2@sepia.wv.tek.com>
Source record: 97627

I was interested in Henry Titchens question about building a
diode detector aircraft band receiver, and had similar thoughts
about using them for HF bands.

So my question is this:
Has anyone successfully built and used a germanuim crystal receiver
on the HF bands for QSO's recently? If so, how do you keep out the
local AM radio stations without compromising sensitivity? Is picking
up code without a side tone oscillator practical?

I know that this is not a new question, and many might wonder why on
Earth a person would waste their time on this. I find that I still
have the same enthusiasm in the hobby that I had as a kid, and enjoy
all facets of the hobby: QRP-SSB, fast scan TV, packet, homebuilt
duplexer design, etc. I also collect antique radios, and have thought
of operating a 1920's-1930's vintage station one of these days.
(receiving your signal well on 1st and 2nd harmonic) ;^).
Picking up a signal without a battery has always fascinated me.

Thanks,
Ed Burress

What's your application? You could use a converted SSB CB radio. They
are single-conversion superhet receivers, typically with a crystal filter
in the i-f with about a 3 KHz bandwidth.

It is perhaps possible that you could generate sufficient RFI to
interfere with the operation of their stereo (as well as every other
consumer electronic appliance within a wide radius), but besides being
illegal, it would be stupid. Either they, and the rest of your neighbors,
would come over and beat your butt, or they'd just add some simple RFI
suppressors to their stereo and turn it up louder.

It will be much better to deal with the problem in a legal fashion.
If you can't come to an amicable agreement with them, and they really
are playing the music so loud as to be a public nuisance, then file
a complaint with the local police for violation of the local noise
ordinances (almost every community has one). If for some reason your
community doesn't have a noise ordinance, file a civil suit directly.

If you don't wish to involve the law for some reason, then I suggest
you invest in a cheap pair of hearing protectors, available from any
industrial safety equipment supplier, or a shooting supplies outlet.

The 141T is just a display section, and a box for the RF and IF modules.
What RF and IF sections does it have?
Is it 0-1200MHz then the RF section ought to be 8554B, and the IF section perhaps
a 8552A.
I got a full assembly here right in front of me...got it for free at my job...ericsson.
I like it!

Source record: 97634

Actually, the test circuit described below can have a significant
effect on the measurement.
If you have the typical ham scope with a typical 10x probe, the probe
itself can add up to 20pf. If you use coax to connect the scope
or the signal generator, add 30pf/foot.

So, use a bigger capacitor if possible.
Put a big resistor in series with both the generator and the scope.
I use 100K, but you may have to use less depending on your scope and
generator.

Or skip the scope and use a grid dipper to determine the resonant
frequency.

It is used with the 1815 TDR plugin to create a 28 ps Time Domain
Reflectometer system. It is useless alone and requires the 1815, an
1106B tunnel diode mount, the interconnecting cable and a 180 series
mainframe to be used.

Source record: 97639

But I thought the point of using VLF for communicating with subs was that
those low frequencies (provided the power was high enough) could penetrate
into the ocean so the submerged subs could receive messages. You want
to have some means of reaching the subs without them having to surface.

I seem to recall reading something about how the communciation was very
slow because even at high power it was hard to get the signals through.
So it was a terribly weak signal at the sub, rather like moonbounce
signals.

When the sub receives the transmission, then they can surface if need
requires it and conditions allow it.

I don't think there is any way that the submarines would transmit on
VLF, since they would need very large antennas and probably high power
to get the signal out.

I assume that shortwave may have been used years ago, since there
weren't satellites and they did want range. But VHF/UHF with satellites
now has the advantage of a reliable link, and one that is harder
to listen in on.

I've thought about this a lot. It's unclear what equipment used those IFs, but these days it might be "cruel" to scrap a radio of that vintage for its IF cans than try to piece it together again as a historical artifact.

My suggestion is this, which is something I have hoped to try for some time: Create your own IF transformer using two windings of fine wire on a toroid, and a pair of Arco ceramic trimcaps on either side. It won't *look* like an IF transformer, but it should work reasonably well as one, especially if you can keep the Q high. You lose the ability to control the degree of coupling with a movable slug, but you can tune the notch with the independent trimmers and play tricks with the bandwidth that way.

If anyone else has tried this, please speak up. It's on my project list, but the list is kind of long right now.

> not be the best way to go.

Having done some experiments with QRP SSB/DSB on 80 metres, I'd agree that there appears to be a threshold power below which 80% of 80m SSB contacts are not really successful/a battle with QRN, etc. Sure you can make contacts below this threshold, but it is hard going, and successful contacts where you're not repeating everything are few.

Above the threshold, it becomes more a matter of 80% of contacts being successful, and operating becomes more enjoyable.

From my own experiences a power of 1 watt DSB on 80m is probably below this threshold most of the time. However, 5 watts SSB will almost certainly be above it (Note that QRP is anything less than 10w SSB). Thus QRP SSB is definitely possible (and practical) on 80m, and I'd disagree with Gary that 100w be considered a practical minimum.

My furthest contacts with 2-3w SSB on 80m have been close to 2500km, but contacts of anywhere up to 1000km are quite practical on a fairly regular basis provided static levels aren't too high. However during such times, 100 watt stations have a battle, and many turn off.

It would be nice if you showed fault in my analysis of your claim a low Rp
results in more stability, instead of launching into another lie.

Rich, you plainly claimed this:

In article <measures-ya02408000R0402970132530001@news.vcnet.com>,
measures@mail.vcnet.com (R. L. Measures) writes:
> In other words, the arcing that destroyed the original bandswitch and

>replacement bandswitch in Rick May's AL-80 can not be explained by a load
>fault. The only thing that was altered after bandswitch #3 was the
VHF-Rp
>of the VHF suppressor in the AL-80. The original suppressor has an Rp of
>about 166 ohms at the anode resonant frequency of160MHz. The replacement
>suppressor has an Rp that is around 101 ohms at 160MHz. Since voltage
gain
>is essentially Mu*Rp, decreasing VHF-Rp decreases VHF voltage gain. //

You are plainly saying a lower Rp suppressor reduces gain, and citing that
as an example why your nichrome works miracles.

A month ago it was Q, you even advertise it very plainly as a low Q cure.
Now you change your fire-chant from muttering low-Q low-Q to muttering Rp
Rp.

If a lower Rp suppressor results in more stability, the ultimate low Rp in
a suppressor would occur with a short. The highest Rp and most unstable
suppressor would be an open.

According to your theory, if we connect a 5000 ohm resistor in series with
the anode it would make the PA less stable than with a zero ohms series
resistor. According to your theory, removing all suppressors from all
equipment, and replacing them with shorts, will result in maximum
stability.

Rich, do you wish to correct your statement? Or does it stand? I'll bet
some follower's faces are redder than a glowing 3-500Z anode. Can anyone

with real world PA experience support Rich's theory? If we replace a series resistance with a dead short at the tube's anode connection point, does stabilty improve as Richard claims?

In article <measures-ya02408000R0502971814530001@news.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:

>Who are the 'others' who have shown what 4.32 ohms of R in series with 1100
>ohms of anode Xc does to harmonic suppression at 30MHz?

Measures law of simplification of circuits:
A complex circuit can be understood by picking two random parameters that give the desired answer and ignoring all others

Not recently, but as a kid I built a shortwave crystal set. It only received the stronger stations in the 31 meter band but I didn't any trouble with local broadcast interference. I kinda got it to work on shortwave by accident but I remember that there was a book at the library on building crystal sets that had all kinds of complex, multi-coil designs to improve selectivity. Would be a collector item now along with the the black bakelite crystal sets with cat whisker and Galena rock that my Dad used to bring home for me.

Michael, If, by "Connector", you mean the cable that connects the HW-101 to the power supply -- As I recall, this is a cable with an 11 Pin plug on each end. *IF* this is correct your friend may be able to build a cable without too much trouble. I see in the All Electronics Winter 1996/1997 Cataloq page 19 they show: 11 Pin Plug - Amphenol #86CP-11 - Standard 11 Pin plug. 1.2" overall dia. CAT# PL-ll $1.00 each.

I don't know that I've ever bought anything from this supplier and I don't know that this is the right plug but it might be worth a try if you don't have a better shot.

All Electronics Phones:
Order - 1-800-826-5432
Customer Service and Information (818)904-0524
FAX (818) 781-2653

I think I have some info on the HP-23A out in the garage. I can probably locate it without too much trouble if you think it would help.

I am looking for a very poor radio FM transmitter.
It should (has to) send inside a building (500m2), or less.

I live in Vienna, Austria, Europe.
If you know addresses where to order please reply to
------- wgantner@t0.or.at -------------------------.

thank you in advance

Hi,
I would appreciate any help with a overdrive problem I have. I built several amplifiers using mosfets. These devices only require a few watts drive to get max output. I am driving the amp with my ts430 which put out 100 watts. If I overdrive just a hair I blow the transistor. I have blown 4 now at $180 a piece. I need a complete protection circuit for this amp. I got the amp design from motorola. It works fine but is bare bones. No protection circuitry, no filters and no ALC just the amp. Does anyone know where I can get schematics for these circuits I seek that will be usable with my amp? Thanks.

>advantage,
> but what?

The grids are made from tungsten or other high temperature materials Bill.
The gold is necessary to prevent poisoning of the grid by cathode
materials as they migrate from the cathode.

The gold is generally used only in a metal oxide cathode tube. In a
conventional directly heated tube, the grid is almost always not plated.
When the grid is not plated, grid dissipation is MUCH higher. That's
because the grid can be run much hotter without the very soft low melting
point gold getiing hot and contaminating the tube. If the gold gets hot,
or is hit hard by electrons, it evaporates (it can do that without even
"melting") and deposits on the cathode and other places where it ruins the
tube.

Conductivity has nothing at all to do with it, the gold is put there
simply because without gold the grid of a MOX cathode tube would quickly
be ruined by contamination.
Gold is a necessary but troublesome evil.

True enough, Joe, but some of the paticipants in this discussion used this ploy.

> Webster's New World Dictionary of the American Language: libel (n)
> any written or printed statement ... tending to expose a person to
> public ridicule or contempt or to injure his reputation in any way.
>
Bzzzzzzzzzzt. ....
My copy of the Webster's New World Dictionary says: LIBEL n. 1. Any false and malicious written or printed statement..... The key ingredient in the definition of the word LIBEL is the word FALSE. It appears that you adjusted the defination, Mr. Subich. ....BTW, is that a bullet hole in the toe of your left shoe?

For example: The 8877 has a maximum filament voltage rating of 5.25v. If I state that a certain 8877 amplifier manufacturer applies 5.90v to the filament of the 8877 when the amplifier is operated from 240.0v mains---and the actual filament voltage is 5.0 volts, then the statement is libelous. However, if the filament voltage measures 5.90v, the statement that the filament voltage is 5.90v is not libelous---even though the manufacturer's reputation was damaged by the disclosure of such information.

Let's say that YOU bought such an amplifier, Joe. When you measured the filament voltage, it was 5.90v. However, when you telephoned the manufacturer and voiced concern, you were told that 5.90v was perfectly harmless to the 8877, and that it might be best to leave the engineering to recognized amplifier experts.

...snip...

You are correct about VLF freqs penetrating salt water but subs don't have to "surface" to receive satellite comms. They go to periscope depth (typically about 60-65 feet) and expose 3 or 4 feet of periscope. A little known fact is that periscopes contain far more antennas/LNA electronics than optics. To make things efficient, trips to PD are usually scheduled so that several chores can be taken care of simultaneously, for example the reception of a NavSat or GPS satellite fix and the blowing overboard of sanitary tanks and garbage. This is more efficiently done at PD due to the lesser amount of air needed to overcome water pressure than if we were deeper.
>
> I seem to recall reading something about how the communciation was very

> So it was a terribly weak signal at the sub, rather like moonbounce
> signals.

Correct. Submarines have 2 VLF antennas - a loop, shaped like a big football and a long wire that can be reeled out several thousand feet. To receive with either, we have to slow down and often manuever the boat to obtain best signal strength. This is a very slow process due to our speed and the length of the wire. About the only time VLF is the top choice is when its the only choice - under the polar ice.

Hi

Found a pretty nice looking MCR-100 UHF repeater made by Motorola, with the service manual and duplexers for a decent sounding price. The service manual leaves a lot to be desired by way of information on the controller board functions and no info at all is given on reprogramming.

Called Motorola's many numbers and so far have not had, nor do I think fair to expect, much luck getting info on this unit. The people I have managed to talk with don't recognize this model.

It appears to be a 25 watt, 5MHz split repeater with a programmable controller board that has several telephone type ports on it. I can't determine if there is a CW id'er, or DTMF capability.

Does anybody have familiarity with the MCR 100 repeater? I'm looking to have it reprogrammed to replace the flaky tube UHF repeater that we have now. I guess that we'd be interested in any source, Boston area preferred, for additional accessores and upgrades as well as reprogramming if I can't do it myself.

This looks like a pretty good quality unit that might be a good place to begin assembling a more robust repeater system around.

Appreciate any comments.

Bob Crowley

: up code without a side tone oscillator practical?

Hey, you said "question." Isn't that supposed to be singular?? I count at least three explicit ones there! ;-)

First, I haven't done it recently.

Second, you better plan on a good filter...if you can get a loaded Q of 300 and unloaded Q of 600, which I think is possible, though not easy, you would have 3dB loss and a bandwidth on 4MHz of about 13kHz at the 3dB points. That's really not too shabby. It gives you over 40dB attenuation a megahertz away from the resonator center frequency. (The actual design of a filter I'd use in such a "crystal radio" would be more complicated than a single resonator, but I just wanted to suggest those numbers as a starting point, that it would be conceivable to do something like this.)

I can tell you that for extra credit in a graduate level circuits class I took long ago, I built a TRF receiver with a filter designed to receive an AM station 120 miles away in the presence of a local station 50kHz away; it worked, though rejection of the local station was not perfect. It was basically the filter, a single RF amplifier, a detector, and an audio amplifier. It illustrated that the paper designs we did for the class really did work, but that there were also parasitic resistances and reactances we might not have considered on paper.

Finally, what you'd pick up with a CW signal is a changing DC level at the output of the detector. Unless you amplified that and drove a telegraph sounder with it, I don't think it would be very practical. If you add a sidetone oscillator, you have, essentially, a direct-conversion receiver, where the sidetone oscillator is the local oscillator and the diode becomes an unbalanced mixer. I'd make it a little more complicated and use a double-balanced diode ring mixer instead...or at least a couple diodes in one of the single-balanced mixer circuits found in the ARRL Handbook. Oh, and SSB without the sidetone is probably totally unrealistic...as if the CW wasn't. (Though the CW is certainly possible for stations that put more than a few millivolts of RF into your antenna.)

Ed Burress (edbu@sepia.wv.tek.com) wrote:
: Is picking up code without a side tone oscillator practical?

To what I wrote in a followup posted a little while ago, I'd add
that in the days of spark transmitters, the signal was really
"MCW" -- amplitude modulated CW. So you could pick it up on
something like a simple crystal detector OK without a sidetone
oscillator. Perhaps you'd like to suggest a return to spark
transmitters along with crystal radios... maybe we could get the FCC and
other regulatory bodies around the world to set aside one day when
spark transmissions would be allowed for a few hours... ;-)
(Just so long as the emissions outside the ham bands were properly
attenuated... ;-) ;-)

>but what?

That's a good question, Bill. The underlayment for the grid is a tungsten alloy, and that's a pretty poor conductor for a metal, so skin resistance would be rather high if it were bare. One would think that silver plate would be used, or even a copper plate, but they may be too reactive with the getter (and other things). Gold is fairly corrosion resistant as well as a fairly good conductor. It also plates easily. Besides, you know you can always charge more for gold plated hardware. :-)

But the main reason appears to be to reduce primary grid emission. In a tube with an oxide cathode, barium evaporates from the cathode over time, and can bond to the grid. This increases grid emission due to the low work function of barium (that's why it is used on the cathode, to increase emission). Barium doesn't bond readily with gold, which is primarily why gold is used to plate the grid in tubes with an oxide cathode.

The BASIC stamp is a microcontroller that can be programmed in a
modified BASIC programming language. They are popular because they are
cheap, small, and easy to program.

If you want more information I suggest you go to

>
> Thanks,
> Ed Burress
> KC7GFX

Hi Ed OM,

Your question was really three questions.

Firstly, any crystal receiver can work on HF to copy AM stations.
Many have been built. Selectivity is
a problem.
Secondly, elimination of AM radio station QRM is accomplished with
high-pass and/or bandpass
input filters ahead of, (but not loaded down (de-Q'd) by, the crystal
detector load), same as in any
other receiver. You must be familiar with this, having designed
duplexers.
Thirdly, you cannot conveniently "hear" an unmodulated, keyed carrier
(A1 CW) with an AM receiver.
Consequently, you cannot do it with a crystal receiver, which is merely
an AM receiver. You can do it
if you make a locally generated signal (oscillator), and use it to beat
against the received on/off
keyed signal, generating a difference frequency in the audio range.

This local oscillator has always
been called a BFO. (Beat Frequency Oscillator).
See any ARRL handbooks of past several decades for more info.

73 and GL,

Don, W6JL

True enough, Joe, but some of the paticipants in this discussion used this ploy.

> Webster's New World Dictionary of the American Language: libel (n)
> any written or printed statement ... tending to expose a person to
> public ridicule or contempt or to injure his reputation in any way.
>
Bzzzzzzzzzzt. ....
My copy of the Webster's New World Dictionary says: LIBEL n. 1. Any false and malicious written or printed statement..... The key ingredient in the definition of LIBEL is the word FALSE. It appears that you adjusted the definition, Mr. Subich. ....BTW, is that a bullet hole in the toe of your left shoe?

For example: The 8877 has a maximum filament voltage rating of 5.25v. If I state that a certain 8877 amplifier manufacturer applies 5.90v to the filament of the 8877 when the amplifier is operated from 240.0v mains---and the actual filament voltage is 5.0 volts, then the statement is libelous. However, if the filament voltage measures 5.90v, the statement that the filament voltage is 5.90v is not libelous---even though the manufacturer's reputation was damaged by the disclosure of such information.

Let's say that YOU bought such an amplifier, Joe. When you measured the filament voltage, it was 5.90v. However, when you telephoned the manufacturer and voiced concern, you were told that 5.90v was perfectly harmless to the 8877, and that it might be best to leave the engineering to recognized amplifier experts.

Michael Black (blackm00@CAM.ORG) wrote:
: But I thought the point of using VLF for communicating with subs was that
: those low frequencies (provided the power was high enough) could penetrate
: into the ocean so the submerged subs could receive messages. You want
: to have some means of reaching the subs without them having to surface.

..

: When the sub receives the transmission, then they can surface if need
: requires it and conditions allow it.

Or just send up an antenna. It doesn't take much of an antenna to receive
a satellite transmission.

: I assume that shortwave may have been used years ago, since there
: weren't satellites and they did want range. But VHF/UHF with satellites
: now has the advantage of a reliable link, and one that is harder
: to listen in on.

The Jim Creek Naval Radio Transmitting Station (note the unidirectional
implication in the name) has been in operation since the very early
'50's, and before it, a station at Battle Point on Bainbridge Island in
Puget Sound was used. The Battle Point station had some impressively tall
guyed towers. Not sure about the frequency they used, but it was pretty
low. The Jim Creek antenna system is also quite impressive, but not as
obvious till you get pretty close to it, since it's mainly made of wire,
and is in a more remote area.

Man, that sounds like it's getting expensive! Try the ARRL Handbook
for ALC schematics. I know it sounds wasteful and inefficient, but
how about using a big swamping resistor across the input like some of
the old amps used? Dentron had some like this, instead of a tuned
input, there was a big resistor across the input.

I too have been seeking 1600 KC IF transformers for years and have yet to find one. Like Jeff, I too have had the idea of making my own IF transformers using a toroid. I'm not sure that winding both the primary and secondary on the same core would be a good idea though. The coupling would be much too tight for an IF transformer. In order to remedy this problem I was thinking to use seperate toroids for the primary and secondary and a link of a small number of turns between them. The number of turns in the link could be adjusted for optimum coupling. Any thoughts??

Schematic Display and Print Functions
Graphics Plotter and Printer Support
Multiple Filter Combination for Complex System Design and Analysis
Synthesis to User-Specified Frequency Response in the Circuit Type of Choice

Users can design filters of lowpass, highpass, bandpass, bandstop and allpass types to 20th order. Filter characteristics supported include:

Butterworth
Chebychev
Inverse Chebychev
Elliptic (Cauer)
Bessel (linear phase)
Real Pole
Gaussian
Transitional Gaussian
Linear Phase with Equiripple Error
Symmetrical Ripple Delay
Papoulis
Parabolic
Catenary
Elliptic Contour

Implementation Circuit Topologies Include:

Multiple Feedback
VCVS
Biquadratic
State Variable
Reticon and national SC Filters
Single Opamp Biquad (SAB)
Dual Opamp Biquad

Simulator Interfaces are Included For:

SPICE
Touchstone (HP/EEsof)
Super Star (Eagleware)
ECA
Netopt

New! Standalone nodal circuit analysis is now included!

The Webb Laboratories Active Filter Design Environment is in use by EVERY known active filter supplier in the United States. Active filters are as necessary in today's systems as ever before, with operating frequencies increasing. Designs based on simple tables are no longer adequate. Your design group can now take advantage of the choice of the professional active filter houses. Complex filters can now be synthesized and reliably manufactured in-house, with component tolerances taken into account!

A method I used with great success allows quite accurate inductance measurement over a wide range. Firstly you need a frequency counter that can go up to 4 MHz (I have one of those built into my multimeter :)

Then you need to make a VFO circuit with known capacitance in the tuned circuit. However, make the variable capacitor fixed - preferably use a silver mica or polystyrene capacitor. My unit is built in a die cast box and used a 10uH RF choke for the inductor. With total capacitance about 190 pF, the unit operates on about 3.7 MHz.

The unknown inductor is inserted in series with the 10uH coil. The greater it is the lower the frequency. Thus you can calculate the inductance from the capacitance across the tuned circuit and the frequency displayed. Then take off 10uH to compensate for the series VFO coil. Though it is a bit fiddly (you need to use a calculator), the method is accurate, and allows measurements to bemade from values well under a microhenry to several hundred microhenries or more.

Of course, instead of the frequency counter, you could use a calibrated receiver and make up a chart showing the relationship between oscillator frequency and inductance.

If you take a low quality AM-only MF/HF receiver and tune across the bands, you can sometimes hear very high pitched CW-signals (provided that no resolute attempts have been made to limit the audio bandwidth) which are most likely some intermodulation products between the CW signal and a strong broadcast station. I do not know if this is practical in a crystal receiver with only one stage generating intermodulation products.

Someone from Region 2 wrote in rec.radio.amateur.* that in the 7100-7300 kHz range, you could turn off the BFO and use the strong European broadcast carriers as BFOs to pick up local CW signals between them.

There is only one sure protection from overdrive for your amplifier.
That is a power attenuator on the input sufficient to knock the full
100 watts of your exciter down to the level the amplifier will tolerate.
ALC is inadequate to assure you won't see high drive transients, and
the power control of the TS430 is too unreliable to trust. Of course
you could bypass the PA of the TS430 and use its driver to drive your
amplifier. That would also assure you that overdrive would be impossible.

You could find out the max voltage allowed at the input of the device
and fit a Zener diode of that voltage across it.
Over driving will cause clipping and therefore distortion but it should
at least save the device while you are tuning and experimenting.

Let us all know how you get on.

The spectrum is essentially folded back upon itself in the first step of the Weaver method. You can think of this as sub-nyquist aliasing. Now normally you couldn't subsequently treat the aliased component separately, but because you do an identical aliasing in the other channel, when you recombine them, the aliased parts do separate back out and you get a full bandwidth signal.

The advantage of this method is that any imperfections in phase and amplitude balance result in products *on channel*. The ordinary phasing method results in products *out of channel*, IE the undesired sideband. So the Weaver method is more neighbor friendly than the ordinary phasing method in this regard. However, it results in a less pure on channel signal, and in practice there's a nasty phase distortion at the pivot frequency in the middle of the channel. That makes it an ugly method for data modulation.

>Can you give a comparision of performance of Tx/Rx made in the three mthods?
>Also, maybe you could help me build my rig I'm planning for the 20M band.

Ok, all the following comments apply equally to reception and transmission, except for the ones that don't. :-)

The filter method is brute force. It is conceptually simple, and its characteristics are mainly just the characteristics of the filter used. Since that is typically a commercial filter, and is consistent from unit to unit, a very manufacturable design results. But the characteristics of the filter are also the source of problems for this method. Of course the filter is fixed frequency, and that forces you to use superhetrodyne

technique. And to achieve sufficient opposite sideband rejection, the filter shape factor has to be very sharp. This causes phase and amplitude irregularities in the passband (and especially near the passband edges). This causes problems for data transmission.

OTOH, the phasing method results in a very clean signal with smooth phase and amplitude characteristics on channel. This makes it well suited to data transmission. It can also be done on channel, meaning superhetrodyne conversions are unnecessary. It can even be done at high level, meaning a chain of linear amplifiers isn't needed following the modulator. This can result in a more efficient overall design. Its deficit is that phase and amplitude imbalances cause products outside the channel, IE opposite sideband suppression suffers if good phase and amplitude balance are not maintained.

In practice this often means that each unit has to be adjusted by hand for best opposite sideband suppression. This is undesirable in a mass produced product. Also, because the modulating audio spans octaves, achieving precise audio quadrature over the entire range can be quite challenging with conventional analog methods. It is a trivial matter for DSP processed signals, however, since a simple Hilbert transform will give you perfect quadrature. With audio DSP becoming de rigeur for today's designs, this becomes a natural method.

The Weaver method is conceptually difficult to understand, has more transforms which require precise phasing and amplitude balance, and has a dirtier passband. Balanced against that, it is more neighbor friendly in that it generates no products outside the passband. It may have some merit as a transmitting scheme, but does nothing useful for you as a receiving scheme.

Now I've mentioned data modulation in regard to each of these methods. That's primarily because it is my own primary interest, and also because it can be the severest test of each method. For ordinary voice operation, the phase and amplitude imperfections of the filter and Weaver methods aren't very significant. Both the Weaver and phasing method require good audio quadrature. This can be difficult to achieve with conventional analog circuits. But if you are going to DSP process the audio anyway, it is trivial to achieve perfect quadrature via a Hilbert transform, so these methods become a natural choice.

If you intend a completely analog design, use of the filter method is probably the simplest way to get good opposite sideband rejection. It is easy to understand and easy to adjust. You do need the expensive filter, you will need to use superhetrodyne technique, with image filters, mixers, and local oscillators, and you'll need a chain of linear amplifiers to boost the signal up to transmission level. All that adds cost and complexity, as well as additional areas to generate performance deficits.

A modern phasing rig, with DSP processed baseband, high level modulation (Class D) to power FET mixers, and using a DDS chipset with quadrature

output, would be the slick way to go if you want to build something high performance, efficient, and SOTA. Cost is likely to be comparable to the analog filter rig too if more than QRP levels are intended. This isn't for the faint of heart, however, because there are few published designs to rip off. You'll be on your own.

Gary,

On the contrary ... if the data is coded so that there's a null at DC in
the
data's (folded or I/Q) baseband spectrum, then one can insert the channel
center
carrier as a pilot (through the use of a DC term) and use the pilot in the
proper
receiver (Weaver, plus a special inner structure which does feedforward
correction for both the fading amplitude and fading phase of the channel).
This eliminates (to the precision of the processing) the "irreducible error
rate" phenomenon which plagues the multipath channel.

If you are interested, we can discuss this in e-mail ... no sense in upsetting
the beepers with "technical stuff" <grin>.

> The Weaver method is conceptually difficult to understand, has more
> transforms which require precise phasing and amplitude balance, and
> has a dirtier passband. Balanced against that, it is more neighbor
> friendly in that it generates no products outside the passband. It
> may have some merit as a transmitting scheme, but does nothing useful
> for you as a receiving scheme.

Actually, the second I/Q mix in the Weaver receiver is the *perfect* place to apply feedforward corrections in amplitude and phase, allowing one to collapse those big, "fuzzy" symbols that the multipath channel presents back into the nice, crisp points that the transmitter generated. This can be done on a sample by sample basis, in a deterministic fashion, without the "guesswork" that goes on in a traditional adaptive equalizer.

It is also significant to note that the corrections *must* be applied in a feedforward fashion and *also* that the corrections for amplitude and phase *must* be done simultaneously for best results ... correcting either the amplitude or the phase independently doesn't product the desired results because it in further spreading of the signal, which is contrary to the goal.

Additionally, the "inner structure" I allude to is also capable of being used
to implement a FM/FSK receiver with performance directly equivalent to a limiter/discriminator ... providing an easy path to multimode operation (or backwardly compatible interoperability with conventional NBFM radio as in the 2m/440 bands and/or the "refarming" environment now occurring in the VHF/UHF PLMR bands.

Other than the obvious changes to get the unit to transmit and receive simultaneously, you will have to improve the shielding of the front end. We basically removed the front end assembly, sealed it up in a RF tight box, brought power in through feedthru capacitors, and used double shielded coax on the RF input port.

I didn't like the squelch operation, so it uses an external squelch. Its been running for years without a glitch. Knock. Knock.

If you can find a copy, the Jan/Feb 1983 issue of RF Design magazine has an article and a Basic program for the design of IF amplifier strips. The article describes a number of coupling techniques, and solves for the component values. It uses Y parameters for the active devices, and computes the IF strip gain and stability. The article describes the iterative design of a 21.4 MHz IF strip. I have a copy of the program revised for MS Qbasic, but cannot furnish a copy of the orignal article.

1545. Help Required - HV PSU

Dear All,
I am attempting to make a 1.2kV PSU for a WWII airborne TX (T1154) work. This PSU used to have a metal oxide rectifier in it. This has since gone west and I have replaced it with a load of silicon. This in itself works fine its just increased the volts by about 200!!!.

In addition, the regulation is c****p sorry - very poor. The TX is used for morse and to add insult to injury the VFO is unregulated, being fed directly from the HV rail. This means that as the current swings from key up to key down (about 20 - 200mA) the VFO moves to another band.

I want to add a regulator to the output of the PSU to allow it to stay closer to 1.2kV and have tried several approaches, all of which have failed. Can somebody help out. I want a design for a regulator that I can build into the PSU.

The PSU is a transformer, rectifier (full bridge) and two inductor/cap elements. I don't mind having non original bits inside the box but want to keep as much as I can.

I'm after example circuits - help, help, help.

<< As I recall, Mr. Rauch measured the internal VHF resonances in a tuning capacitor. All tuning capacitors have them, Peter. Do VHF resonant circuits always exhibit low reactance at VHF?

--Rich-- ag6k, 805-386-3734 >>

Aw shucks, Rich. I must admit this question is a real poser, I don't know how to answer it. I had always assumed that at the "resonant" frequency, there would be no reactive component. Is j 1 and j -1added together equal to 0? Where does stray reactance come from in a resonant circuit?

I always assumed that the "impedance" of a resonant circuit was defined by the presence of resistance loading (loaded Q), or by the resistive losses inherent in the design of the capacitor or inductor (Q factor).

Are we talking about series or parallel resonance?

Please excuse my "bad science" in making these unwarranted assumptions.

Hello,

If i understand you, you use a scanner to receive NOAA pictures ?
Could you please send me the frequenties for NOAA and is this wide or
narrow FM ?

The antenna is this also importend ?

Thanks for all your help,

One of a kind custom built 4CX1000 for sale. Uses remote control panel
with large LED readout display for vacuum variable cap. and roller
inductor position. Large meters for plate current and voltage, bias
voltage, and grid current. Tank circuit components motor driven with
potentiometer feedback. Uses remote blower for cooling (included).
Power supply components included but not assembled. Several spare tubes
available. Approx 1500 watts out with 15 watts in. (Has input pad).
Tested and operational, needs to be assembled with PS etc.
Make offer, or trade for tabletop legal limit amp.

Is that similar to the HD/HDW-1780? I assume you are looking for the
EPROM contents? If so you can do a DUMP from the MISC menu. This
performs an Intel hex dump of the memory content that can be used to
make a new EPROM.

NOt sure if that helps with your model or not :) Hope so.

Through the magic of modern technology, Carl (WA6VSE) and myself have been in contact with each other. We have agreed that this in-fighting, here on both rram and rrap does nothing to protect the ARS from the battles that are being fought now and soon to be declared.

In light of this, Carl has agreed to keep ALL discussions on a civil basis (no insults, innuendo, etc) and I have agreed to stop my self professed harassment of Carl.

We both feel that these newsgroups can best be used to further the ARS and that there is essentially room within the ARS "charter" for all concerned, both those advocating the retention and those advocating the elimination of the code requirement.

I personally will endeavor to keep this "peace". I have every confidence that Carl will do so as well and we both encourage all participants in the newsgroups to do the same.

Now is not the time to be a house divided.

As was said once is now said again "Once again, peace is now at hand and we can see the future.

On behalf of Carl and myself

Apparently I missed it, Peter. What are the values of Ls and Rs?

Taken from a post made by Mr. Measures: --
--Rich-- ag6k, 805-386-3734
> N7WS further states on his web page:
>
> "Some mathematical manipulation can demonstrate that shunting
> the conventional suppressor with additional resistance will

> to nearly overlap the nichrome curves above about 30 MHz. Below
> 30 MHz, the Rp of the adjusted conventional type will be higher
> than the Rp of the nichrome device."
"at VHF, there are only slight differences between the effective
parameter values for the two types of networks."

Taken from a post by Ian, G3SEK

All that I was saying to Rich was that if he wanted to make the
conventional suppressor have *exactly* the same Q as one of his, at any
desired frequency, he only needed to shift the whole curve up or down by
a small amount (this being a useful property of the log scale).

Good news, Rich! I think I was able to round up the material
you requested and have posted it above. I hope this helps
with your requests!

:> My copy of the Webster's New World Dictionary says: LIBEL n. 1. Any
:>false and malicious written or printed statement..... The key
:>ingredient in the definition of the word LIBEL is the word FALSE. It
:>appears that you adjusted the defination, Mr. Subich.

I have copied the applicable sections of the definition directly.
However, since you insist on making FALSE accusations, here it is in its
entirety:

| Webster's New World Dictionary of the American Language College
| Edition, Library of Congress Catalog Card Number: 64-12965
|
| Libel: 1. Any written or printed statement or any sign, picture,
| or effigy, not made in the public interest, tending to expose a
| person to public ridicule or contempt or to injure his reputation
| in any way: cf. slander. 2. the act of publishing such a thing.
| 3. anything that gives an unflattering or damaging picture of the
| subject with which it is dealing. 4. in admirality & ecclesiastical
| law, the plaintiff's written statement of the wrongs he has suffered.
| v.t. 1. to publish of make a libel against. 2. to give an
| unflattering of damaging picture of; say or print unfavorable or
| false things about. 3. in admirality & ecclesiastical law, to
| bring suit against by presenting a written statement of grievences.

You will note that the word "false" appears only once in a relatively
long defintion. Even then it is coupled to unflattering with the
conjunction "or" meaning that either action is sufficient to
constitute libel.

It seems that you are as selective in your language as your science.

Mr Measures, are you using your "network analyzer calibrated grid dip
meter" to make legal judgements now?

OJ Simpson is considered a "public figure." In the case of a public
figure, libel requires intentional malice. But then, since you don't
appear to understand the difference between measurements made with a
GDO and a network analyzer, the differences between "public figures"
and the rest of us would be lost on you.

Greetings Gang...

While looking for some other information I came upon another article for the Eggbeater antenna. Look at the October 1984 issue of "73 Magazine". This one uses square elements instead of the circular elements of the April 1971 issue of "QST".

The UK QRP club's comic 'SPRAT' had one of these in its latest issue.
Its based around an analogue devices programmable modulator chip and a
microconroller. The frequencies you are after would possibly require
reprogramming but the basic circuit is applicable to your need.

Try SPRAT (GQRP club) issue 89. Pages 15-25 have a DDS for a 5 MHz
VFO which can also generate DC to 15 MHz in 1 Hz steps.

GQRP are on www.gqrp.demon.co.uk and the editor is at g3rjv@gqrp.demon.co.uk

Hello,

Can somebody tell me haw I can make bandpass filter for 137 Mhz ?

I have problems with my receiver, cous 5 miles away from me is a huge radio
station at 98 Mhz,
There signal is to strong for good receiving any other frequency.

But i like to receive at 137 til 138 Mhz.

So have some of yours a schematic diagram or PCB layout for making a
bandpass filter ?

ALL INFORMATION IS WELKOM !!

THANKS IN ADVANCE

Source record: 97434

Mr. Measures has himself in a real jam with his nichrome. He avoids a simple question that pins him down. This one is crystal clear, and drives a stake in the heart of his nichrome theory.

In article <measures-ya02408000R0702970726430001@news.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:

W8JI asked in part,
>> It would be nice if you showed fault in my analysis of your claim a low Rp
>> results in more stability, instead of launching into another lie.

Rich responded:
>If your 'amplifier expert' analysis determined that the voltage
>amplification of a triode is basically NOT equal to Mu*R, this discussion
>has reached impasse.

What does that mean? Here was the question.....

In article <measures-ya02408000R0402970132530001@news.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:
> In other words, the arcing that destroyed the original bandswitch and the
>replacement bandswitch in Rick May's AL-80 can not be explained by a load
>fault. The only thing that was altered after bandswitch #3 was the VHF-Rp
>of the VHF suppressor in the AL-80.

Let's just pretend Measures is correct about the above and not lying, Measure then claims....

>The original suppressor has an Rp of
>about 166 ohms at the anode resonant frequency of 160MHz.

That's the stock suppressor, 166 ohms (by the way 160 MHz is NOT the frequency an AL-80 oscillates at if the suppresor is removed).

>The replacement suppressor has an Rp that is around 101 ohms at 160MHz.

That's his suppressor, 101 ohms.

>Since voltage gain is essentially Mu*Rp, decreasing VHF-Rp decreases VHF voltage gain.

Rich is very plainly claiming LOWERING parallel resistance of the suppressor will decrease VHF gain and increase stability. He cites that as proof damage to the switch was from a parasitic.

But he forgot we can all apply common sense to his claim, and check it out.

1.) If a lower Rp suppressor (such as the suppressor Measures touts) results in more system stability, the ultimate reduction in Rp must occur with a dead short for a suppressor.

2.) If Measures is correct, the highest Rp would result from an open anode lead, or a very high resistance in series with the anode lead.

According to Measure's theory, the one he uses to slander Amerirtron, if we connect a 5000 ohm resistor in series with the anode it would make the PA less stable than with a zero ohm series resistor.

According to Measure's theory, removing suppressors from equipment and replacing them with shorts will result in maximum VHF gain reduction and maximum stability.

Can anyone with real world PA experience support Rich's theory? If we replace a high resistance in series with the anode lead with a low resistance, does stabilty improve as Richard claims?

How many people have found smaller resistors and inductors in suppressors improve stability? Rich claims a lower value of suppressor parallel impedance results in better stability, that means a lower value parallel resistor and less reactance in the suppressor.

The lowest value resistor is zero ohms, the smallest value inductor is zero turns.

Does any find that removing turns from the suppressor coil, partially shorting it out, or removing it entirely INCREASE stability? Rich claims a lower value of RP results in better stability.

Why won't Rich answer this directly?

Rich, if lowering Rp increases stability (as you claim) why isn't the best suppressor a large surface area silver plated lead from the anode? If you are absolutely stuck, can you find a friend or follower to help you with this?

I faced this problem in a commercial design. You will never cure it with
ALC, because the response time of an ALC system will be far too slow.

You need to use an attenuator in the PA, so the radio is running at full
power. There are no other reliable solutions to the problem you have.

First thought is a (stack of ?) zener/resistor to reg the vfo. Would be feasable if not too much current is required.

If you must regulate the HV...
Can't think of a specific circuit published somewhere, but wonder if regulating (using) the ac line input would work... Feed back a sensing line/circuit from the hvdc to the control of a triac on the line in.

Here's a copy of the postcard I sent to Mr. Miklos:

"12-18-96
Mr. Miklos
If you are the same Joseph Miklos who used to work at the Varian-Eimac
Salt Lake City plant, I would like to speak with you on the telephone, at
your convenience, on my dime. If you are not this person, please put this
in the nearest roundfile.
Background: I am also an amateur radio operator. I was first licensed in
September of 1955. My FCC callsign is ag6k. Between October 1988 and
January 1994, I wrote some QST magazine articles. .I am currently involved
in a debate about these articles with some of my critics on the
rec.radio.amateur.homebrew UUNET Newsgroup. One of these critics
repeatedly cited sources at Eimac who disagreed with virtually everything I
wrote in the QST articles. These sources were identified as Mr. "XXX",
"they", and "it's the entire staff" at Eimac. I kept pressing for names.
Finally, he produced the name Buzz Miklos. He said Mr. Miklos was employed
at the Salt Lake plant. He said his job description was "R+D engineering
manager". However, there were some things that did not appear to add up, so
I telephoned the personnel department at Salt Lake. The personnel
department confirmed that you had worked there, told me that you were an
"Engineer B", and volunteered the opinion that you were a widly respected
engineer at the plant. .I asked if you were the "R+D engineering manager".
They said that you were not. ....Obviously, somebody was not

telling the truth.
Another thing that did not appear to add up was that this critic told me you refused to talk to me on the telephone. This struck me as a bit odd. I have never spoken with you on the telephone. It seemed to me as if the critic was afraid I might phone you to check out the critic's story.
Please telephone me collect anytime (I keep odd hours) at the telephone number on the address side of this postcard. If I'm out, please leave a message, and I will return your call ASAP. "

Perhaps a ZD <below>, but beware of the shunt capacitance and zener
speed.
If your (IF) rig has analog power control imput / ALC...
I would monitor the drive voltage to the amp using a directional coupler
(see this month's QST) or a fast "pick-off" Ge diode. Run the sig
through comparator (with some hysterisis feedback). Condition the output
of the comparator to be compatible with the rig's control requirement.
Use the comparator reference voltage to set the cut-off level.

Hi Steve--

It's not clear HOW you are driving this experimental amp with your TS-430. Are you driving it through a 10 dB or greater resistive attenuator--or by simply turning down the power control on your radio? If you are turning down the power control, you should be aware that Kenwood (and most other) transceivers have a significant amount of ALC overshoot. In other words, the first few milliseconds of you transmission may pump a short pulse in excess of 150 Watts onto the gate of your device before the gain-regulating circuits kick in. Indeed, the mechanical noise generated from closing the PTT switch is all it takes. Since the gate of a FET is punched through by voltage and not by dissipated power, even one cycle of RF at this power level is enough to do the deed. If you attenuate your exciter properly and run it at full power--or choose a lower-power exciter--this problem should go away.

In this case you need to bypass the 98 Mhz signal, haven't worked it
out, but you could easily do it by trial and error, so here goes my wet
finger in the air.....
start with about 10 turns of 16-20 guage wire (not very thin stuff)
formed around a pencil, stout hookup wire will do, put in series with a
low value variable capacitor or trimmer one end connected to the antenna
input and the other to ground. Cut and adjust till you have got rid of
the signal, then replace with the capacitor with a fixed one of the
approximate value, squeeze the coil turns closer or farther apart/cut as
necessary and make a permanent connection, with a suitable trimmer, youd
save yourself the second readjustments.
Regards

Good day. I have a coil of military coaxial cable, and the specifics are as noted:

Manufacturer: Plastoid Corporation

Type: M17/163-00001
Mil-C-17 77314

What I would like to find out is this:

* Characteristic Impedance:
* Velocity Factor:
Capacitance per foot:
Dielectric Constant:

*Note: These are the most important to me, so if possible, I would like this information.

Your help is truly appreciated. Thanks.

>So have some of yours a schematic diagram or PCB layout for making a
>bandpass filter ?

Well, Geert, have you tried a notch filter for 98 MHz? That is probably the simplest solution to your particular problem, and it will have less insertion loss than a bandpass filter. A quick and easy notch filter is simply a 1/4-wave coaxial stub Teed into the antenna line. Just take a piece of coax slightly longer than an electrical quarterwave at 98 MHz and put a connector on one end. Attach that to a Tee fitting in the antenna line. Now trim the length in tiny steps until the 98 MHz signal is attenuated the most. Tape up the open end, and you're done.

The notch will be deepest with high quality coax, airline is best, foam is second best, and ordinary RG-58 is worst. With airline, you can achieve a notch of nearly 30 db, RG-58 may only give a notch of 12 db. If one such notch is not enough, you can add a second one. The attenuation values will add.

>
>Eric, WD6DGX

A toroid has a closed flux path, so the mutual coupling of two
coils wound on a toroid should approach 1. This is normally
considered "a good thing" (TM). But if you are trying to gain
selectivity by loose coupling, of course, it is not. Now use
of two toroids and a link still gives a coupling of 1, so you
gain no advantage from doing this. This is basically a back
to back transformer circuit, and the link windings will simply
carry a greater current to maintain a coupling of 1.

To reduce the coupling below 1, you need to introduce some
loss element to take the place of the flux leakage in an
ordinary air core transformer. Rather than a link, try a
small value capacitor top coupled between the two coils.
That's the approach I took for the preselector in my
receiver.

Hello Out There...

Anyone have any experience with the 23cm PSK packet-radio RTX for
1.2Mbit/s by Matjaz Vidmar, S53MV in Slovenia?

(those interested can find more info at:

http://www.hamradio.si/hamradio/packet.html

a quite nice site, BTW!)

Anyway...

Sounds interesting at least but due to my eyesite, I have trouble
reading the online schematics and layouts.

Would be interested in the opinions and experiences of those that have
looked at and/or tried this system.

Take Care & 73

Hi Mike, give Heathkit a call, they are still alive and selling to the
educational world plus they still sell the IDA-5001-1 kit. I couldn't
locate my latest catalog but the 1993 issue still shows this unit for
sale. Call Heath at 1-800-253-0570
or Electrolab LTD in Canada 1-800-267-7482. Either number should get
you some answers as there is PC software offered in the catalog.

Sounds like a familiar problem. Leads to obvious next questions:
1) Was the mixer diode(s) burned out?
2) Check the condition of the blocking capacitor found inside
the HP s/a's- I found they get broken easily.
3) For the -80dBm what is the Video BW and Res BW?
4) Can always try a LNA but will do nothing for Dynamic Range.

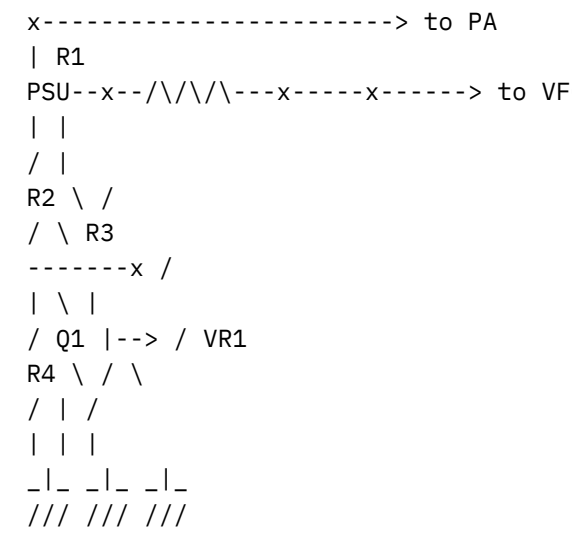
>_Woody_

I've tried that approach. It can work Ok with a steady load, but the
dynamic regulation is poor due to being restricted to switching at the
line frequency. It isn't a good solution in this case.

Probably the best solution is a shunt regulator. The real problem here
is the high key up voltage. So loading the supply will pull that down.
Even a heavy bleeder resistor would do wonders. Changing the power supply
to choke input filtering would also help this problem.

We really don't care much that the voltage varies to the PA. The
real issue here is the VFO as you noted. I'd suggest separating its
power feed and feeding it via a shunt regulator. That won't require
dissipating much power, since the current draw of the VFO is only
about 0.02 A. A stack of zeners can be used, or you can use a transistor
as a dynamic load. Here's an example circuit:



Select R1 to drop 300 volts at 30mA, IE make it 10k. Select
R2 to drop 900 volts at 30mA, IE make it 30k. R3 should be
about 300k, and VR1 should be about 10k. Adjust VR1 to set

the desired regulated voltage. I'd suggest regulating for
1 kV to the VFO. Use a transistor with a CE breakdown of at
least 350 volts, a TV horizontal output transistor will do
nicely. R4 should be 10k, and will limit the voltage across
Q1 when the regulator is heavily loaded and Q1 is biased
nearly out of conduction.

These values are just crude off the top of my head numbers.
If you want to carefully analyze the circuit, you may be
able to choose more optimized values. But these should
work if we assume the VFO draws 20 mils. The idea is to
size R1 so that more current than the load requires has
to be drawn to achieve the necessary voltage drop. This
gives the shunt regulator something to work with.

I am not positive about this, but I think that the razor blade is used to touch a specific spot on a germanium crystal. Hence, the germanium crystal is actually the detector, just like crystal sets you buy today.

I hope this helps, and I am also interested in any other information you receive.

Actually the razor is used as the crystal detector and a "cat wisker" is
used to tune it.

It was used durring WW2 for GI's to keep up with world events while they
were in the POW Camps.

My Dad and I made one back in the early 60's as one of my first projects.
He was a mechanic on the B-17's in England and all airmen were trained on
how to make this radio (and other things), also the playing cards when
placed in water would peel apart to unfold into a map of the country side
of where they were flying. Hope that they picked up the right deck of
cards. ;)

Hope that this helps

1605. Frequency Doubler ICs?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-09 00:00:00 UTC
From: ianls@patrol.i-way.co.uk
Message-ID: <32fdbb9a.577340@news.i-way.co.uk>
Source record: 97508

I intend building a 10 mtr CW transmitter using a VFO. An oscllator running at 14 MHz and doubled to 28 MHz would be ideal, but do we still have to depend on diode doublers or class C amps to do this or is there a nice little chip? A TTL doubler would also help isolate the VFO from the o/p stages. I've looked thru the usual component catalogues, but can't find anything! But there must be something in the 1000s of lised ICs that will do the trick...

Thanks,
G4JQT

>
Years ago (!) when Mocom 70's were brand new we attempted to modify
these for full duplex operation so we could use them in our RCC mobile
telephone service. They worked, and I've always been a Mocom 70 fan,
but the desense was terrible (meaning the receiver sensitivity degrades
to very poor performance when the transmitter is simultaneously running)
since the transmitter and receiver circuits are side-by-side on the same
board. If these mocoms were cheap enough (getting there!) the only way
I'd attempt it would be to use 2: one for transmit and one for receive
and mount them inside good shielded boxes with appropriate filtered and
bypassed power and control leads.
Since you already have 2 this may be feasible for you IF both are in
working condition and you don't have to rob one to get the other
working.

If they are listenin to Fm radio, you can purchase a device from most any consumer electronics store that allows you to transmit CD audio (or whatever) to a nearby stereo. Most devices will allow you to tune them for the entire band. Simply attach a more resonant antenna, tune to the station they listen to, then pump the most absurd music into thier system. If they change stations, you can too.
Of course, interference of this type can get you into a heap of trouble.

For cassette players, a 25W mobile 440 rig, into a 4 ele beam pointed at the equipment in question will quiet that device fo a while. Although I do not reccommend this.

Story: I had a gal at work that cranked her headphones up SO loud, I could hear Stevey Wonder's harmonica down the hall and into the bathroom! She worked in the office just behind the wall, and behind me. She was using the cassette player on her walkman. First I brought a CB walkie talkie in, a 5W'er.. Did no good. Then one day I was trying to key up a local 440 repeater when I noticed the audio on her headphones quiet a bit on transmit. I placed the ht as close to the wall as I could, keyed it up, and it wiped the audio out completely. For some reason I could not hit the repeater that day, but sure was fun trying.

All in fun guys.
(or the info nazis will getch'a!)

The way I remember hearing about it was to tack the blade flat and make a cat's whisker from a paperclip twisted at the end to hold a piece of pencil lead. The pencil lead was then moved to the most sensitive spot on the blade by trial and error.

I gather you have your 14MHz at TTL levels already... if so, and if it's a decently symmetrical square wave, you can double it nicely using a one-shot that's triggered on each edge. (That is, trigger on both the rising and the falling edge.) The one-shot should have a period 1/2 the total period of the 28MHz output: a bit shy of 18 nanoseconds. You might have trouble doing it with a typical oneshot chip, since it's pretty short, but you can just feed the the 14MHz into one input of an exclusive-OR gate, and delay the 14MHz by 18 nanoseconds and feed it (either true or inverted) into the other xOR gate input. The output will have some second harmonic (of 28MHz) which could be nulled by adjusting the 18 nanosecond delay and the symmetry of the input waveform, but the output should be mostly the desired 28MHz, and its odd harmonics.

Source record: 97353

The schematic and details of the TNC-1 were published in 73. Around
'84/85/86. I don't recall the exact issue, and I certainly can't put
my fingers on it easily. It was a period when they had the index on
the cover.

It used a 6809, and a Western Digital HDLC controller. You used to
be able to get the source code from TAPR, though unless you had the
compiler that they used, it would not be too helpful. Presumably
at one point you could get the software in ROM.

Maybe five years ago (around the time when they had the TNC-1 sourcecode)
you could get a schematic for the TNC-2 from TAPR. They also sold empty
boards, and the software in ROM separately. I'm not sure you can
get that from them anymore, but one would think you could still get
the schematic. Maybe by now, the source code is available, and since
the TNC-2 used the Z80, putting the source code into machine code may
be easier.

The TNC-2 is really a much more standard dedicated computer. You
should be able to scrounge up the parts really easily and really cheaply,
unlike the TNC-1 which used harder to find components. You could even
make the task of building the TNC-2 easier by forgetting the modem
that was originally used, and plugging in a modem like that used
with software TNC's.

So TAPR is the place to look, though I don't think you'll find this
info online. I think it's
www.tapr.org

By the way, the ARRL website is

1617. Re: Frequency Doubler ICs?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-10 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.970210224209.16579B-100000@Ocean.CAM.ORG>
Source record: 97354

In the old days, you'd see single-transistor doubler stages. There
was a time when Doug DeMaw would describe double-ended doubler stages,
and at one point he was showing them using CA3028 differential amplifiers.

One form of doubler that hasn't got much press, presumably due to parts
count, is using a double-balance modulator/mixer. Feed the input
signal into both inputs, and they mix together giving a DC output
(for the difference frequency), and the sum, which is twice the input
(f+f=2f). CIrcuit balance determines how much of the original signal
feeds through to the output.

This has traditionally been rather bulky, since you need a
bunch of discrete components, or something like an MC1496 and all of
it's external components. Nowadays, with NE602's so common, the
scheme could be implemented as easily and as cheaply as some other
form of doubler. Of course, the NE602 has that transistor on one
fo the inputs meant for use as an oscillator, so that might get in
the way of really good balance for this scheme.

The MC1350P/MC1590 IF amp is in effect a double-balanced modulator
equivalent to the MC1496, but with an amplifier on the output. IT
might be worth looking into as a device for this scheme, since they
are cheap, relatively easy to find and need few external components.

I don't think there is much use in going to a digital multiplier scheme
unless you already have a digital signal. Having to convert
to a digital signal so it can be doubled seems like more work than other
schemes.

However, if you already have a digital signal, I've seen doublers using
exclusive-or gates. I've seen the scheme in a number of places over the
years, there was even an article in Electronics Now (was Radio
Electronics) in recent years, but I can't put my finger on a reference
right now. YOu need small pulses to make it work, so usually they
feed the input signal through rc networks. I seem to recall that the
outpu signal is also narrow pulses, which may not be what you
want for a transmitter.

If you already have a digital signal, you might try just feeding it
through a transistor with an LC circuit on the output, to pick off
the desired harmonic.

Yet another digital scheme would be a phase-locked loop. Have a
VCO running on the desired output frequency. Then, have a divider
chain that divides this down to the input signal. PUt this signal
and the input signal into the phase comparator, and use the output

of the phase detector to provide feedback to the VCO. Kind of bulky and not worth the trouble for a simple doubler.

But it is definitely one way of using up all those old FT243 crystals that multiply up to the 6 meter band. In the old days, they'd start with 6 or 8 Mhz crystals, then multiply by 4 (or 3) to 24, then double to 50. The more multiplier stages needed, the more worthwhile the scheme for simple CW or DSB (or phasing SSB) VHF transmitters. For six, some 74-series variant would work for the divider. For a 2-meter or higher transmitter, the idea has occurred to me to find a divider IC from a TV tuner, which could handle the higher frequency and would be easy to find if you can find old tv sets. The idea of using a PLL instead of multipliers is that you don't have to worry about filtering out those lower frequency signals that are part of the process of multiplying up to the desired frequency.

Source record: 97513
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Joe,

I tried it using a Hamtronics transmitting and receiving converter. The transverter output from the 735 is very low (10 mW, I think) - too low for most transverters. The separate RX antenna input to the 735 is a real blessing for transverters, however.

I found the sensitivity a little on the poor side on 10 meters. However, a good preamp on the transverter fixed that (and that is the right way to do it, too). Overall, the 735 is a very good rig to use on the back end of a transverter, but you may have to boost the transmit signal. I used the main antenna output (instead of the transverter output) and an attenuator. I did manage to blast 100 into the transverter a few times, of course :-)

>Ok, but why would cathode material contaminate tungsten but not contaminate
>gold? Would it be from a chemical reaction as opposed to simple deposition?

Hi Bill,

I'm not a metallurgist, I would go to someone with that specific background for help you can absolutely trust. If you like, I can call two or three people who are involved in tube design or metallurgy and ask them.

The reason why it happens was never a concern of mine, since I only need to know that it happens.

I do know, as an absolute fact, skin effect has nothing to do with the use of gold in power grid tubes like those used in amateur service. Grid heating is produced mainly by the kenetic energy of the electrons bombarding the grid. The secondary heating effect is caused by proximity of the cathode or filament to the grid.

Since gold is a soft metal with a low melting point, it "evaporates" from the grid at much lower energy levels than tunsten would. That is one reason why the designer take great care to not place the grid in the electron beam path, and why the grid is so easy to damage in a metal oxide cathode tube. Just like a pan of water slowly evaporates at very low temperatures, you do not need to boil the gold or even make it a liquid to have it slowly migrate.

Try http://www.heathkit.com/

I believe they are on line and maybe able to help you.

I have the software for the Heathkit, so if you run into problems let me
know.

I am editor of our local ham club newsletter and am looking for articles on home brew.
If you would like to contribute such an article of any size (within reason), which you would like to submit to a local New Zealand club newsletter, please E-mail it to me along with your name and callsign. If it is included I will mail a copy of the publication to you with thanks.
All mailings will be answered.

I've been using a program called Microcap for electronic ckt simulation. I looked around the web for later versions of microcap. But I couldn't find any. Can anyone help?

1630. hf amp to 6m conv help!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-10 00:00:00 UTC
From: Robert Dashoff <robert@ucr.campus.mci.net>

I have a little 50 watt solid-state mobile hf amp (DARTZ brand) that I would like to modify to go up to 6m. The manufacturer claims it's range is 2 MHz to 50 mhz but it seems to only work well up to 30mhz. The power transistors are TRW pt9796 7616 c. There are two of them. There are two clusters of toroids with multiple turns of wire running thorough them it looks like a toroid set in the input and also on the output. One set has two rows of six toroids with four turns of wire running though it (larger of the two) and the other is two rows of three toroids and has three turns of wire running through them (smaller of the two). There is a 560pf silver mica cap that looks like it's on the output. Can I maybe change caps or change the number of turns of wire running thorough those toroids? Can these transistors handle that band? Would anyone out there know what can be done if anything to raise the operating freq. on this little amp? Thanks for any assistance. Bob.... KN6GA

MicroCap is available from Spectrum Software. They have a
web site at:

http://www.spectrum-soft.com/

That is *not* correct. The classic crystal radio uses a galena crystal.
Galena is a lead ore. Its chemical formula is PbS, IE lead sulphide.
Now the ore is not pure. There are impurities or *dopants* in the crystal.
These form semiconductor "sweet spots" in the crystal. By probing the
crystal with a "cat's whisker" (a fine stiff copper wire), one can find
these "sweet spots" where the galena acts as a rectifier or diode detector
for radio waves.

The razor blade radio works somewhat differently. The razor blade, a
Gillette Blue Blade, is coated with *selenium*. This is what makes the
blade blue. When oxidized, we have a selenium rectifier (an almost totally
obsolete type of solid state rectifier), which can also act as a diode
detector for radio waves. Again, a cat's whisker is used to probe the
blade for a "sweet spot". Selenium rectifiers don't have a high back
resistance even when carefully manufactured (which is why they are
obsolete), so this crude rectifier won't do a very good job as a diode
detector, and a razor blade radio won't be as sensitive as a crystal
set with a good crystal.

Otherwise, a crystal radio set and a razor blade radio (also called a
foxhole radio) are identical. The only difference is in the material
used to form the diode detector. Both detectors are rather haphazard
in formation. No control has been exercised to insure precisely the
correct type and amount of impurity, IE dopant, is present in a galena
crystal, and little care has been taken to ensure a proper selenium
oxide layer on the razor blade. So a manufactured diode is better.

A silicon diode can be used, but a germanium diode works better
because it has a lower potential barrier, IE 0.2 volt instead of
0.6 volt. This makes it more sensitive. But you can increase the
sensitivity of either type by biasing the diode with a DC source
to very near the barrier potential. This is how detectors in radar
sets worked until the recent invention of GASFET preamplifiers
which can work at radar frequencies.

Another detector used in the early days is the *electrolytic* detector.
This can be quite sensitive. This was commonly made from a small tin
cup filled with fresh lemon juice. A cat's whisker was dipped in the
liquid, then pulled back out carefully to form a tiny menscus between
the tip of the cat's whisker and the surface of the liquid. This also

acts as a rectifier or diode detector. The juice has to be fresh. After it has been exposed to air for a few hours, it oxidizes and loses its rectifying ability. And of course you have to avoid jarring the detector or the menscus will break. This is why it wasn't normally used on shipboard stations.
